1. Wanted Hammerlund Hq 110 I.f transformer

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-01 03:55:03 UTC
From: Garry W Tidler <gtidler@tds.net>
Message-ID: <41d61d0e_1@newspeer2.tds.net>
Source record: 20290

Like to get my Hq 110 working , need a I.F. transformer 455/3035 , part number T-1 k38985-1. Anybody got a parts set under their bench ? The transformer is missing from this set. Could also use a picture of the underside of a HQ 110 showing the hook up of the I.F transformer . T-1.

Garry WW9GT

Don't listen to this guy, his name is BOB SCARBOROUGH from Arizona, he has (5) different usernames on ebay- DESERTBOB-DESERTBOB1-DESERTBOB2-DESERTBOB3-VOXPOPPER- he runs up negative feedbacks, then changes to another username

he bought a VHS dub from me, returned it for another one, then left negative feedback disguised as a neutral

he also bought an alignment tape from me, made a copy for himself, then returned it for a full refund

now he's following my auctions daily, and dogging my Usenet posts- all are warned, to BAN ALL HIS USERNAMES FROM YOUR EBAY AUCTIONS

8. Looking for Old QST Receiver Schematic\Article....

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-01 16:31:23 UTC
From: Jim Flanagan <jflan@tampabay.rr.com>
Message-ID: <vfABd.164216$8G4.38695@tornado.tampabay.rr.com>
Source record: 20197

Hello...
Back in 1973, when I was in the process of getting my Novice license, I built a simple tube receiver from a construction article that came from a Boy Scout Merit Badge pamphlet on 'Radio'. The radio didn't work well because I was young (16) and really didn't know what I was doing.
Recently, I have had a desire to rebuild that radio for sentimental reasons and am trying to find that schematic. The problem is, I cannot remember the name of the article. My belief is that the article was originally published in QST around 1965 and was granted reprint permission in the 'Radio' Boy Scout merit badge booklet.
Does anyone have any recollection of which reciever that I am referring to. What I remember was that there were 5 tubes (I think) and used plug in coils for changing bands. It also was a supre-regen type receiver.
If anyone could help me with optaining the schematic for this, It would be most appreciated.

Thanks and a very happy new year...
Jim

Sounds like YOU have the agenda. No auction number, and you don't identify
yourself. And voxpopper hasn't left a negative for anyone going back a year.

So put up or shut up.

Hi, Jim
I thought I might have found what you were looking for. But, then I did more digging and the situation seems muddier. The 1968 ARRL Handbook has a project called "The Junior 'Miser's Dream'". However, it is a 5-tube superhet receiver. It was based on a May 1965 QST article subtitled "A Description of the 'Miser's Dream'".

This receiver is also bandswitched, rather than using plug-in coils. The Handbook project is described as using some of the principles of the QST article, but with some simplifications and reduced cost.

Most of the information I have seen on regens and super regens use one to four tubes, depending on whether they use an RF amp stage, solid state rectifier and dual-function tubes, and whether or not a speaker was driven. The 1956-1959 KnightKit Space Spanner, for example, used a 35W4, 50C5, and a 12AT7; but, the 12AT7 is a dual-triode, so that's actually 'four' tubes and a diode. I don't recall what the famous Ocean Hopper had for a tube complement, even though my Elmer broke me in by letting me borrow his for awhile back in the day.

An old RCA tube manual I have shows plans for a four tube regen. See <http://www.mines.uidaho.edu/~glowbugs/12at7_regen.html> for a one tube, plug-in coils, regen. Also, look at <http://www.hvinet.com/rjmattson/56noviceRcvr> for a nice regen based on a 1956 QST article.

This site is a treasure trove of info on old ham radios: <http://oak.cats.ohiou.edu/~postr/bapix>

Earlier tonight (yesterday evening, rather!) I ran across AA7JC's site at <http://www.lotts.net/ken/ham/>. He built a neat little regen, and he has several mp3 files you can listen to of QSOs. Amazing clarity!

Well, I hope you find what you were looking for, and if you do, I'd be interested as well. You can email direct, just leave out the **'s in the address.

Source record: 20206

I had also printed the "improved" diagram, but, although it is better than the other one, there still are many details which cannot be read, and the "good" part is anyway fatigating to read.

People keep compressing schematic diagrams with jpg or worse djvu, that are unsuitable for diagrams or text. So, a great part of the BAMA schematics are poor.

The only way to obtain good diagrams is to use lossless compression, like gif. People seems to be generally unaware that, with diagrams, gif produces a smaller file than jpg. For instance, converting a bit-map diagram of 1,137 kB, I obtained 42 kB with jpg and 13kB with gif.

Thanks for your suggestion anyway.

Source record: 20208

The connections for T-1 are found on the schematics that are available on the BAMA mirror site. http://bama.edebris.com/manuals/

Be careful, there are three different versions of HQ-110. Two of them have a 2.58 Mhz converter crystal and one of those has a 560 pf cap across the "link" winding that couples the 3 Mhz signal from T-1 to T-2. The third version uses a 3.49 Mhz crystal for the converter stage.

Just check each one against your receiver before beginning the repair work as the wiring in the area is slightly different on each.

You can't make a general statement like that about jpg. When you make
a jpg file, you are allowed several "tweak" options that change how
much compression, and how much degradation is allowed. I can quite
easily produce a jpg that is much smaller than any gif, and has similar
level of quality. Most folks just accept the default parameters, which
are set for a reasonable quality color image.

Chuck,

jpg is perfect for images and photo, but is not good when there are sharp black / while transitions as it occurs for circuit diagrams and text in general.With jpg, unless you reduce the compression level a lot, you will typically see small "dots" scattered around the lines representing the circuit wires. And wires do not appear "solid" any more. So, diagrams do not come out clean.

For schematic diagrams quality is the priority, not file size. Lossless compression (gif, png) is the only way to get a good diagram.

If you have time try and download the "improved" HW-101 schematic diagram from BAMA (or much better its mirror site http://bama.edebris.com/manuals/), you can judge yourself whether a technican can work comfortably with that.

A couple of years ago, when Barry was still editing Electric Radio, he mentioned something in a column about a museum in New Mexico he had visited. As I recall, the main thrust of the museum was old, large power-generating and control equipment.But I think there was some old large broadcast stuff there too.

It sounded interesting at the time, but since I live in Michigan, I didn't pay too much more attention to it.

Life being the interesting entity that it is, I now find myself in Phoenix on a business trip, and when I leave here in a couple weeks or so, I'll be driving back to my beloved mitten-shaped peninsula. I happened to remember Barry's column, but for some dumb reason I left my entire collection of ER's home instead if bringing them with me.

Could some kind soul dig through their pile and come up with a name/location please? I tried a couple of Google searches, but evidently wasn't hitting the right words.

Thanks in advance.

Tony,

I went looking, and as far as I can tell, bama doesn't have a jpeg of the HW101
on his site, only djvu.

If you set the quality of the jpeg rendering to 77%, you get about
the same size as a gif, and the "dots" you are complaining about
go away. Add some smoothing, and you can get the same result
with around 50%, and 1/3 the file size.

Gif works, but there are better lossless algorithms readily available. The
typical Gif schematic I see is B&W, stored in full 24bit color, with large
borders around the important stuff. And as a result, they are very large
in size. Some simple adjustments would improve this, of course, but most
folks are so dumbed down that they haven't a clue about things like that.

I have worked with numerous schematics of very poor quality, and somehow,
I can always get the job done. But as always, YMMV.

People ask questions like this all the time, but they forget that most construction articles, especially of simple equipment, were pretty generic. The only difference between that regen over there and this regen over here would be because someone used what they had on hand, and it was time to run another regen article. So the coil forms might be a different size or form, causing the winding information to be different, and they'd use a different triode (because that's what they had), and the layout would be different because they had a cake tin instead of a piece of wood to build it on, but the basic circuit would be the same.

Unless one can recall something specific about it, there really isn't any way of tracking down the specific one, though every time there are posts like this people recall the thing they remember that was similar.

In other words, the specific article won't really matter because they are generic.

Unless that receiver tuned VHF, then it's not a super-regen, but merely a regen receiver; people often do confuse the two, or forget the difference.

It may be easiest to track down Boy Scout websites or archives to find the specific pamphlet, because unless someone can definitely remember seeing the pamphlet and the original article, it will only be a guess. And I suspect there is bound to be some collector, not likely here, who does have the pamphlet. People collect all kinds of things.

My guess about the regen is that it's likely to be whatever was included in the ARRL's "How to Become a Radio Amateur" from that era. I gave my one and only copy away decades ago, but I gather they always had some sort of regen in each edition, though I recall by the time I got a copy in 1971, it was a transistorized version. But from the mid-sixties it would be a tube-based receiver, and it makes sense that they'd use that receiver in a Boy Scout pamphlet.

It uses one each of standard 4-pin and 5-pin plug-in coil forms, which
are a little hard to find these days. Everything else can be found in
most any tube-junkie's pile of parts.

>Unless one can recall something specific about it, there really isn't any

>like this people recall the thing they remember that was similar.

The article is in the "Radio" merit badge booklet, copyright 1965 by
the Boy Scouts of America. The article is reprinted from the July 1963

issue of QST. The receiver is called the "Novice RS-3". It's a cool
little radio. Built it myself a long, long time ago and it works
pretty darn good.

>In other words, the specific article won't really matter because they
>are generic.

Not too long ago, I recall a ham selling (on E-Bay) replacement 'chrome' dial inserts for the Heath, National and other tuning dials.

Of course I didn't take advantage of this at the time and now need a handful of these, for the NC-270, NC-300 and SB-101 dials.

Does anyone know if this person is still offering these replacement inserts and can provide contact info?

Thanks very much!

Emil KA8GEF

I know who you mean but I can't remember his ebay name.

One item to consider regarding these inserts. I bought a pair for a NC-183. One of the inserts was bad when I got it. The seller packs them between two thin sheets of cardboard and then mails them in an envelope. One of the inserts was wrinkled and unusable. I got a replacement pair (free) but one of the replacements arrived in the same damaged condition.

My attempt to mount them on a NC-183 tuning knob was thwarted by the fact that the knob changes shape over the years and was "out of round". The insert would not fit. I had to carefully take the insert, using a bench grinder, change its shape to slightly oval.

Bottom line: nice product, poor shipping, too tight of tolerance to fit most old knobs that are not perfectly round.

Good luck.

==========

I saw a discussion on the QRP-list about helping
out the Tsunami victims by giving up a trip to a
QRP event or not purchasing that new radio.

While that is admirable and the victims can sure
use the help, I offer an alternative thought.

Instead of not buying that radio, buy two. Take
the second to a UPS store. UPS will send the
item to actiondrop who will sell it on eBay, take
their normal fee, and send the proceeds for
Tsunami Relief. The details are at
http://www.auctiondrop.com

Others can bid on the items on eBay knowing that
their "play" money is going for Tsunami Relief.

The result is that the QRP vendors have increased
sales which will strengthen their business.
Radios and other items are available for the
enjoyment of all, and the victims receive
financial support.

Another possibility. Make a pact with yourself
that for each QSO you make, you'll send a dollar
to Tsunami support. Pick something fun so that
helping out isn't a matter of doing without, it's
a byproduct of having a good time.

========== End ==

I sent the above to a QRP-list and this is what came back

Ya know, I'm not going to "engage" that list administrator.

I thought I had a valid suggestion. The original poster in the thread started out saying that he was going to take $1,000 from his ham radio budget and send the cash to a charity. While that's noble and sure could help, I had another way that he could help out and still support Ham Radio vendors and let others give too.

Oh well.

$645 for an SB-104A? That's high, but not insane.

>>Why do you worry about how others decide to spend THEIR money?

>Because it raises price standards for everyone else.

That's a side effect of a free market. Would you rather there were price
controls?

>Next time you go to
>buy an item at a hamfest, the guy selling it will say, "well, I hear one of
>these went for a million dollars on Ebay..."

I've heard that many times. My standard answers are:

"This isn't eBay, it's a hamfest"

and

"Then sell it on eBay"

>Inexperienced bidders who don't
>know what things are worth, and bidding wars between people who desperately
>have to have an item, tend to raise the overall market value of an item more
>than it should be.

Whoa there!? "More than it should be"? Who gets to say what some piece of old
radio gear is worth, other than the buyer and seller?

eBay is just a great big worldwide online hamfest that goes on 24/7. Of course
it's going to raise prices - just like prices at Dayton, Rochester, Deerfield
and Gaithersburg are/were higher (on average) than at some small local hamfest.

The higher prices are bad for buyers, of course, but they're wonderful for
sellers. More important, higher prices tend to keep things out of the landfill.

I recall when ARC-5s were a few bucks each at most - and also when a lot of them were dumpstered because the owner had gotten tired of carting them to hamfests trying to sell them.

No, in this case it's the result of two different markets that don't really
communicate well. Ebay has provided a market for buyers and sellers to get
together more conveniently, which is a good thing. But it has also provided
a way for people who don't know what they are buying to get into the act.

This results in things like current production items selling for higher than
list price on Ebay. This is a surprisingly common occurrence, and I have sold
a few items like that myself, sadly enough.

But when you have folks who don't know what the current value of an item
is getting into the act, the value is going to change. And it will change
even though the actual supply and demand don't change at all.

No, in some cases, eBay reduces prices, when people out there realize how
many copies of a "rare" item there really are.

In the case of items that really _are_ one of a kind, there is nobody who gets
to say what something is worth other than the buyer and the seller. But in
the case of a readily available item, especially a current production item,
there's a fair market value.

This is a good thing for the most part... the ARC-5 example is a weird one,
though, because some of those sets are worth a fortune while others still are
worth only a few bucks. This means if you're buying one, you really need to
know what you are buying so you don't overbid or underbid outrageously.

Agreed! But because it allows a seller to (potentially) reach a much larger number of buyers, there is upward pressure on prices. OTOH, because buyers have access to more sellers, there is also downward pressure on prices. So far, the upward pressure has outweighed the downward.

In other areas the reverse is true. Some years back, a few friends of mine had "rare" Beanie Babies they thought were "worth big bucks". Then came eBay and they discovered how "rare" their collections were(n't).

> But it has also provided
> a way for people who don't know what they are buying to get into the
act.

Isn't that true of *any* market?

Current production is a completely different situation from stuff that
is no longer produced.

> And it will change
> even though the actual supply and demand don't change at all.

The change is due to an increase of demand. Those who pay $150 on eBay
for a new widget that they could buy through a conventional dealer for
$100 obviously don't know that the conventional dealers exist. Or if
they do know, there is some reason they won't buy from the conventional
dealers.

It's like the person who will go to a Wawa (local convenience store)
and pay more for an item than an Acme (local supermarket) is charging -
even though the Acme is across the street and both stores are open!
Acme has express lanes so it's not the time factor.

how
> many copies of a "rare" item there really are.

Agreed. The Beanie Babies example shows that. But in the area of old
radios and related parts, I'd say that eBay has generally driven prices
up.
>
> In the case of items that really _are_ one of a kind, there is nobody
who gets
> to say what something is worth other than the buyer and the seller.
But in
> the case of a readily available item, especially a current production
item,

> there's a fair market value.

But in general the "madness" is focused on things not in current production, like the $5100 unbuilt Heath AT-1 kit from 1956. Its value is perhaps 1% FMV and 99% rarity.

Who determines FMV for a current production item? If it's the manufacturer, how come some car dealers could tack on "ADP" to cars in short supply/high demand?

As stated before, current production is a different game than old stuff.

>
> This is a good thing for the most part... the ARC-5 example is a weird one,
> though, because some of those sets are worth a fortune while others still are
> worth only a few bucks.

How much an ARC-5 is "worth" depends entirely on buyer and seller. The situation is complicated by the large number of different models, types, etc., that are nominally called "ARC-5" even though many of them are not. In any event, it's still a matter of classic supply and demand.

> This means if you're buying one, you really need to
> know what you are buying so you don't overbid or underbid outrageously.

But isn't that true of *any* item not in current production?

For example, some years back the 4D32 tube brought very high prices and was considered "rare" to the point that the value of certain BAs was depressed because they used that tube.

Then a bunch of NOS surplus 4D32s showed up on the market. Apparently they'd been used in some military system or other and a considerable number had been warehoused for decades until that system was no longer in operation. 4D32 prices dropped quite a bit.

Interesting thing about the $645 SB-104A is that it started at $25...

--

I think the real difference of eBay is the auction aspect. At a hamfest there's typically some hoss-trading, unless the seller makes it clear that it's "price as marked". Sometimes two or three buyers will compete for a hamfest item, but usually the reality is that the quickest draw with the wallet usually wins.

What's so odd, to me, is the inverted nature of the buyer behavior. At a hamfest, you often have to make a snap decision based on only the info you have right now. At most, you may have a few hours to think it over and perhaps haggle. (How many times have you put down an item, walked away, thought it over, came back and it was sold?)

But most eBay auctions go on for a week! Plenty of time to check out other sellers, including the conventional ones. Plenty of time to think it over and not be driven by the impulse of the moment.

My classic eBay bidding technique is to look long and hard at an item, think it over, and then bid my maximum price - once, by proxy. If I win, fine, if not, then it wasn't meant to be.

You've fallen prey to a common misapprehension:

the "boatanchors" in the newsgroup name has nothing to do with anchors or with boating.

These "boatanchors" are old-timey _HEAVY_ radio receivers and transmitters, generally but not always military surplus, commonly viewed as being sufficient to anchor a boat, and weighing 50 to 500 pounds.

--
ISPs sell connectivity to the world. They provide connectivity to their own facilities. The "product" they sell depends upon the forebearance of millions of other systems whose cooperation is REQUIRED for them to not be fraudulently selling something they cannot provide.

Just one comment. Bidding once is a good technique, provided that you only place your bid 20 seconds from auction end.

As a matter of fact bidding hours or, worse, days before auction end will give others time to place successive bids in small increments, until they surpass you by just 1$.

Its very common in Japanese domestic radios and other electronic gear.
They used them well into the 60s'. You can find plenty of info on the
Japanese sites on the web, just run them thru a translator like Altavista.
Here's a German site thats self-explanatory.

Nope, doesn't work that way. I play it the way Antonio does. I
bid my max or there-abouts, right at the beginning. I've seen
folk inching up their bids but unless they are willing to go to *my*
max, they don't win the item.

If they do win it, hey, congratulations. I'll try again next time.

Look at the SB-104A that just went on the Bay. The proxy was
$1,000. A few bottom feeders inched it up 100, 200, 210, 215, but
they dropped out because they didn't want it enough.

Finally the serious buyers took it to $645.

Sometimes I sorta want an item and set my proxy bid, kinda high, at
the beginning. Folk will inch up, others will try the last minute
bid but how does anyone know what my proxy is?

Bid too high at the last minute and you might find yourself winning
the item at a higher price than you would have paid if you had days
or weeks to think about it.

I *never* pay too much because I have the time to think it through,
set my proxy, and walk away. Many times I've been pleased to find
that no one has been willing to bid at the last minute.

Take a look at http:groups.yahoo.com/group/RadioInvestor

There's a picture of a very nice Collins 75S-1 and discussion of the
investing in boatanchors. (fixing them up too.)

57. 28.635KHz mystery signal.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-05 03:54:57 UTC
From: No Spam <"No Spam"@Nospama.net>
Message-ID: <ifgU75G3LLdo-pn2-XtX4ucNdH3gp@localhost>
Source record: 20145

This came though a listserv. There's a "mystery" signal on 10
meters. The puzzle is that this signal has been heard across the
country.

========== Start Copy ==

GE er GM, All.

Hr flws sig rept 28.635Khz,

Time 0508Z (0008R) 4 JAN 2005

Sig recieved on Icom IC-746PRO, equipped with high stability crystal
freq standard, fed from GAP Titan DX vertical.

Sig taken in USB position after verfifying zero beat in CW of
28.635KHz.

Lvl approx S6-7.

I then applied sig to MixW program, expanded waterfall to X5 scale,
and
used CW mode to get a single cursor I could work with. This signal
looks like, or very similar to, a carrier tonepack, or a telemetry
trace
of some sort.

The signal is composed of 14 discrete tones, all frequency modulated
to
some degree, but most constant.
the frequencies are:
436.0 Hz
705.0 Hz
776.0 Hz
805.0 Hz
831.0 Hz
909.0 Hz
993.0 Hz
1187.0 Hz
1227.0 Hz
1274.0 Hz
1348.0 Hz
1772.0 Hz
1816.0 Hz
2000.0 Hz

The 1348 Hz signal was frequency modulated in a slow digital pattern
and also amplitude modulated in a slow digital pattern
which did not correspond to Morse, Baudot, ASCII, or any other pattern
I
could pick off the top of my head. The FM
is 24 Hz shift, from 1361 Hz to 1336 Hz. I didn't take the time to
measure the amplitude excursions, I wanted to get this posted, because

I',m getting kind of tired --hi--...

I made no attempt to make these numbers work out. I eyeballed the
center
freq of each waterfall trace, as well as the edges of the FM
modulation
of the 1348 Hz trace. It was only after I looked at all the numbers
did
I realize that they all were exact freqs, I.E. no decimal frequencies,

and I was extremely suprised to find the exact 25 Hz FM deviation on
the
1348 Hz trace.

Given these results I have reasonably high confidence in my findings,
and that they are correct. I will continue to monitor this freq
tomorrow and see if I can't make some kind of sense out of this. I am

reasonably certain that I am seeing a carrier tonepack, or a telemetry

tonepack. When I first was looking at the traces, One of them (I
forget
which now) seemed to be FM modulated as a time reference, as the
deviation was all one direction (center downward) and at regular
squarewave like intervals. This particular trace ceased the behavior
when I got around to expanding the waterfall (naturally) but I am
determined to track this thing down and get a handle on it. It
doesn't
sound like any 16 channel tonepack with which I am familiar, nor any
telemetry with which I am familiar, (Yup, I've heard ans 'scoped a
lot
of them, most of which I still can't talk about), but heck, this is
the
21st century--hi--

Thanks to this group for a wonderful mystery!! Sometimes you have to
get off the MARS nets, or chasing CW DX all nite, and solve these
things
(if they can be solved). Since I am retired disabled, I have all the
time in the world to pick around at this enigma.

Hr fols my QRZ.com info for those plotting the sig repts:

========== End Copied report ==

I fired up my SB-303. At 9:00 PM EST Jan 4, 2005. I copied the signal S-5. Very readable on a 50 foot piece of wire hanging out my 2nd floor window.

I can't add anything to the analysis.

Does this have a red dot in the center? There was a special ^E5 used in
Japan called 6E5R but have never seen one here,.

Ralph
"Kip" <Me@home.com> wrote in message
news:h5lmt0l7htrc3b7jv0hls74cpfhuvc77qv@4ax.com...
Hello Group

I'm searching for any information you may have on a 6M-E5 'Magic Eye'
tube manufactured by 'Nippon Electric' and apparently only used in
Heathkit AJ-11S AM/FM Tuners circa 1962. Numerous Internet, phone
calls and e-mails have come up empty.

One of the very few Internet articles I did come across indicated that
the 6M-E5 'Eye Tube' was used in the AJ-11S for economy rather than
using then expensive meters. These tuners used two of these tubes, one
for AM and one for FM.

I have available a 37K scan of our sole survivor.

Any info or advice would be greatly appreciated.

Thank You

Kip

Like several others, I generally set my max bid once and only once. If they inch it up and beat me by a dollar, that's a dollar more than I was willing to spend in the first place.

I may be mistaken, but I believe the 6EM5 is the miniature version of
the 6E5, and was also designated the 6E5M by some manufacturers. That
would be consistent with the 6E5R nomenclature, the "R" indicating a
red dot.

67. Hammarlund SP-120X Problems....NEED HELP!!!!

Ok i am at my wits end on this one. To put it mildly, HELP!!!!!!!!!

This is a Hammarlund SP120X. Here's what i have done to the unit so far: Replaced all "Mica-Mold" and Black Beauty" caps with new moderd units, Checked all tubes and power supply voltages. The problem is the IF strip. In order to get anything to pass through the strip, i have to inject a 465Kc (yes its a strange IF) into the grid of the first tube at a level of 20 millivolts. Thats what i call deaf..... each stage is weaker than the first. I tried a quickie alignment and that made a very slight improvement.

The Plate voltages are fine (about 240 volts), but the screen voltages are waaaaay off. What should be 110 volts is more like 30 volts, regardless if a signal is injected or not. I checked all of the surrounding components, the caps i installed and i have come up with nothing out of the ordinary. If i remove all 3 of the tubes in the IF area (6D6's) my screen voltage returns. For each tube i install, the voltage drops about 20 volts. Is there a possibility of something being shorted in the IF cans?

Thanks in advance!
KC5KLQ

What did you replace the micamold caps in the IF strip with?

Was it this deaf beforehand?

Not unless all three are shorted, I don't think. Do the screen voltages
all come off one dropping resistor from the B+, with a shunt electrolytic
on it?

My 1970 NEC handbook has a 6M-E10, but no 6M-E5. It does list an EM5,
which is a dual section unit.

Have you got the pinout from the manual?

It should not be TOO hard to replace these with a 6E5, or whatever
magic eye the guys at AES have on sale today, but it may take some
repinning and change of resistor values.

>I have available a 37K scan of our sole survivor.

Yes, but do you have the relevant part of the schematic?

I think heath may have had several tuners that used the 6M-E5. Two 6E5s might not even fit in the Heath tuner I am thinking of, and you would have to cut up the front panel to make them work, as well as building new mounting brackets. The 6E5 is quite a bit larger than the 6M-E5.

Source record: 20161

Maybe not the right answer, but some thoughts...

28636 kHz is a common clock frequency for some types of CPUs. Maybe you're picking up the clock oscillator from somebody's nearby old Apple II or something like that.

It can also be used as a NTSC or H-Synch clock for various TVs, VCRs, DVDs, etc. Do a quick Google of 28.636 Mhz and you'll get tons of hits, related both to CPU clocks and video synch signals.

Since it is such a widely used clock frequency, that would explain why it can be heard
by many listeners widely distributed in the US and elsewhere. The various "tones" may
be introduced onto the oscillator fundamental by characteristics of the switching power
supply or other such things.

Another possibility might be some new testing of some balloon-launched experimental telemetry units. Seems some guys in New England did some tests early last year. Maybe they or others are doing it again. See info on:
http://frodo.bruderhof.com/hambone/04b.htm
Seems if this was the case, though, they'd opt for some more 'conventional' mode than a
strangely modulated 14-tone signal. Thus, I'd fall back on my first two ideas.

Ken, WB0OCV

Is the 6M-E5 a 9-pin mini, then? Is it top-view or side-view?

It's top view just like a full size 6E5, I don't remember if the base was
a 9-pin mini, or something slightly special, I seem to remember something
odd about the base.

Only when going against bidders who don't know the product, prices,
or how to use a proxy. What snipers don't realize is the bidders
like Dee and myself aren't interested in playing the, "well, if they
bid $19.00, I'll look in my coffee can for some change and bid
$20.00"

We have "our" price. If you want it more than we do, you're welcome
to it.

I don't know about that, but now that I think about it, the base must have
fit a standard 9-pin mini socket because I didn't have any problems
pluging it into my tube tester. IIRC even though the tubes had pins like
a 9-pin mini they had a black bakelite base like most octal or older
tubes.

Hi Paul,
I suspect it's the screen voltage. Take a look in the power supply.
As Scott surmizes, there is a big droppping resistor in there for the
screen supply, and it probably has drifted very high in value, and maybe
if there's an electrolytic after it that could be the reason, it may be
leaky. (but maybe it had oil filled, I'm not sure, don't have a skem
close by.) When you remove the tubes, it removes the load on the dropping
resistor & the drop across it decreases. You might want to check the
current draw on the screen line, put a meter in series with that lead,
that'd tell you if there is a problem in the rcvr. Somewhere I have
recorded the various currents, perhaps it's on that webpage. The SP-120
will be close to the same.
I had very much the same problem in an SP-210LX a few yrs ago, you can
see some info on that on my website or on The Hammarlund Historian site.

Looks like it's a 7-pin miniature pinout, but on a big fat plastic base
so you may actually be able to shoehorn an octal magic eye tube in there.

Call AES and see what kinds of magic eye tubes they have in stock that
will physically fit into place and have 6V filaments.

The electronic stuff is easy. The schematic on that web site basically tells
you all you need to know; where the plate, filament, grid and deflection pins
are and what voltages they need to see. With this you can adapt just about
any magic eye tube if you can make it physically fit.

It is a standard 7 pin miniature pin spacing on the base. I have
posted a scan of a 6M-E10 (same size) alongside a 1629 for comparison.
The 1629 is pretty much the same size as the standard 6Volt heater
Eye-tubes.

>Looking for pin out diagram for this mic. Pse advise, tnx 73 heytubeguy

EV still has data sheets available. It's basically the same pinout as
the 664 and the other dual-Z mikes.

If you want to figure it out yourself with an ohmmeter, all you need to know
is that one pin is ground, and it's tied to the case. One pin is high-Z
unbalanced out, and it's tied to the ground pin through the high-Z winding
so it'll have a few ohms between it and the shield pin. The other two pins
are the low-Z balanced out, so they will have a few ohms between them but
no connection to the shield. Knowing this, you can figure out the pinout of
ANY dual-Z mike. Find the pin tied to the case, find the pin with resistance
to it, and find the two pins with resistance between them but no connection to
the case.

If I am not mistaken, it is a 9-pin plug.

Rare as hen's teeth.

Excellent article......I hope I never have to actually do this!

Incidentally, I've discovered a pretty good way to remove those C rings.
There are several of them on the gear train of a direlict Hammarlund
SP-600 I'm restoring now. Description follows:

Get two pairs of small needlenose pliers. Ideally, these should be the
kind that are somewhat flat on the ends rather than pointy.

Orient the C ring so that each end of the "C" is pointed towards the
bottom (like an inverted U)

Position the first pair of needlenose so that one tip is resting on the
end of the shaft, toward the top, and the other tip is resting on the
left end of the C ring.

Position the second pair of needlenose so that one tip is resting on the
end of the shaft, toward the top, and the other tip is resting on the
right end of the C ring.

Now, carefully apply a gentle squeezing to the handles of both pairs of
needlenose pliers simultaneously, and the C ring will begin to spread.
When it is about halfway off, you can then insert a small screwdriver
and gently pry the C ring the rest of the way off. Be careful not to
score the shaft.

To re-install a C ring you have removed, simply place the spread-open C
ring back on the shaft, and then take a pair of long nose pliers and
squeeze the edges of the ring until it closes as much as it can on the
shaft. Voila!

> Did you read the part about restringing and the dial directions? That
> gets me wondering about the direction issue again...

I think the consensus was that SX-28s seem to have come working both ways from the factory. My personal preference would be to have the dial move in the same direction as the knob, but some folks (including me) swear they have an original-looking SX-28 that moves the opposite way.

I still haven't decided whether that preference is strong enough to make me cut off the perfectly-functional new bandstring and install a new one that works the other way. Guess I'll have to decide by the time I finish repainting/relettering the front panel. Once the panel is in place, it's trickier, although not impossible, to replace that string.

Regards,

Phil Nelson

Is that the common "octal" plug? They're available as is the
"Loctal", which is what I've heard people call the 11 pin octal
plug.

Reminds me, I should get a few of each and also make up wiring
harnesses for the Heathkit SB-102 and HP-23.

It's a 9-pin plug you seek, not an 8-pin. They're mighty hard to find. Here is a link to a surplus store that may carry them. I've found a few oddball parts here over the years:

http://www.montagar.com/~patj/nortex.htm

73 and good luck!

No, it's a 9-pin plug with slightly smaller pins than the octal. Those used
to be very common for audio transformers, and Amphenol made them. I bet
that the guys making the old Amphenol octal plugs might still make them,
even. It's worth checking the Newark catalogue.

Loctal is a very different thing, with eight pins that are all thinner than
octal pins, and a locking clip in the center. Aside from being used for tubes,
it is very popular for projection lamps.

Then there's the 2nd and 3rd generation effect. "Gramps was always
so happy playing with his KWM-2A; mom sold it after he died; I sure
wish I had one like it now that I'm rich."

>
> >Unlike catalin radios, boatanchors are seldom pretty.
>
> I disagree! Most of them are incredibly beautiful!

Catalins are beautiful in the same way that $6.89 injection
molded brick-a-brack at Ocean City and Miami beach stores are
beautiful.

An SX-62, R/390, HQ-180 are beautiful in the functional, industrial
design sense.

The difference is that a hundred million people were "impressed"
with the look of a cheap plastic item and a few hundred are bidding
the price up. "Hey, that looks like grammie's kitchen radio.
Remember those old days?"

Most folk have never seen an SX-62 so there are proportionaly fewer
who are bidding on them. "What's that thing? It looks expensive."

The Catalin's, frankly, are cheap junk. When they stopped
working, most were tossed and replaced by another cheap radio.

SX-62's and other boatanchors were clearly something special and
even non-working examples were kept on the off chance that it could
be fixed or that a "collector" would want it.

I've said this before. I saw a Catalin go for $20,000 on the Bay.
That's about what twenty Alpha 374's sell for.

Imagine your house. You can have that $20,000 Catalin in the living
room or you can have industrial shelving on one wall in your
basement with Alpha 374's, 5 high and 4 wide.

Do you like Collins? How about 4 perfect KWS-1's lined up?

30 years ago, I visited a DX/Contest station. The guy had 3
operating positions with S-lines and 4 Henry 2K's in a rack. You
could duplicate that or get a Catalin.

And of course, as has been discussed, some of us came along when many of
the boatanchors were outright cheap, because they were AM and CW only, when
SSB had taken over. I had a bunch old equipment go through my hands in
the early seventies, because nobody wanted them. I'd play with them, and then
trade them.

It's only in more recent years that there's been an interest in such equipment
for collecting (well I imagine there have always been a few collectors), and
since we passed through the period when boatanchors really had only appeal as
cheap equipment, what remains is even more rare, thus demand is getting
greater than supply, raising prices.

Three hands not required. I can get one of these rings off in about two seconds using the described method, with two hands, no problem.

I have seen the "official" tool that was originally used to attach/remove these rings, and it is a fairly complicated gizmo....Probably unobtainable unless special-ordered. With that tool, it's a one-handed job.

It's sorta like those plastic Heyco cord strain reliefs that pinch down on
the cable, and then you push it thru a double D hole in the chassis. They
are a b@@ch to put in with pliers, but with the heyco tool, it's a simple
one handed job.

Or piston rings. Duck soup if you have a ring compressor tool - almost
impossible if you don't.

110. Collins 516F-2 power supply voltages

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-07 21:35:43 UTC
From: Antonio I0JX <vernucci@tin.it>
Message-ID: <PgDDd.653715$35.26512544@news4.tin.it>
Source record: 20099

The DC output voltages being higher than what reported in the Collins manual (i.e. 360 VDC and 900VDC), I decided to directly measure the AC voltages on the rectifier plates.

During receive, I measured somewhat less than 2 x 400VAC and 2x1000VAC (filaments voltages are OK, i.e. 5V and 6.3V). So the higher DC voltages are justified.

Does anybody recall having measured said AC voltages?

Thanks and 73

Are the rectifiers solid-state or the original tubes? The manual says
to expect a 12% increase in voltage using solid state rectifiers. Also,
someone, along the way, may have changed the p.s. to capacitor input,
vice choke, in the filter sction??? Regards de K3HVG

AC voltages do not vary whether using a solid state or tube rectifier. By the way I still have the 5U4 and 5R4. My problem is that the AC voltages are high (and hence the DC ones).

Or, like happened to me today. An Item I was bidding on back before Christmas was won by someone who bid twice what it was worth. Today, I was contacted by the seller telling be the bidder had defaulted on payment and offering it to me. My problem/blessing is that I purchased another one off the ARRL classifieds and I am hoping it shows up and is as nice as the one I missed.

Just one comment. Bidding once is a good technique, provided that you only place your bid 20 seconds from auction end.

As a matter of fact bidding hours or, worse, days before auction end will give others time to place successive bids in small increments, until they surpass you by just 1$.

Check with Newark. Amphenol sold some of their connectors to WirePro, which
still mfg. various plug and sockets.

Dick,

Unless I am mistaken, this plug is the 86 series that use to be mfg. by Amphenol and now mfg. by WPI.
http://www.wpi-interconnect.com/salem.htm

In the '80s WPI Acquired several commercial product lines from Amphenol. These products are still produced today at the WPI Salem facility, which operates under an ISO 9002-2000 registered quality system

Here is their catalog (look at Section 4 for digrams and options for 86 series plugs and sockets)
http://www.wpi-interconnect.com/Catalogs/WPICatalog/WPI%20catalog%20PDF.pdf

The former Amphenol product lines acquired by WPI include the following:
a.. 17/117/177and 777 Series D-subminiature Connectors
b.. 26 Series Blue Ribbon Rack and Panel Connectors
c.. 77/78 and 146 Series Tube and Relay Sockets
d.. 78 and 86 Series Commercial Plugs and Accessories
e.. 80 and 91 Series Microphone Connectors
f.. 126 Series Hexagonal Connectors
g.. 133/143 Printed Circuit Connectors
h.. 220/221/222 and 223 Tiny Tim® and Mighty Mite® Connectors
Additional Lines Acquired from Amphenol Include:

a.. CNI Series - Environmentally Sealed Rectangular Connectors
b.. CX Series - Various Military Connectors and Cable Assemblies
c.. H Series - Naval Sound Powered Connectors
d.. Q Series - MIL-C-55169 Submersion Proof Connectors
e.. ONO Series - Poke Home Rectangular Coax Contact Connectors
f.. PL Series - Military Circular Connectors
g.. Q2 Series - MIL-C-55169 Submersion Proof Power Plugs
h.. Q7A Series - MIL-C-55169 Submersion Proof Power Receptacles
i.. 45 Series - MIL-C-55169 Submersion Proof Power Connectors
j.. 84 Series - Miniature High Temperature "R" Connectors
k.. 89 Series - Submersion Proof Power Connectors
l.. 93 Series - Poke-Home Rectangular Connectors
m.. 94 Series - Poke-Home Rectangular Combination Contact Connectors
n.. 126 Series - CNI Environmentally Sealed Rectangular Connectors
o.. 164 Series - Military Power Connectors

patgkz -

This is incorrect information - NOT rare as hen's teeth (made in Salem, NJ) and it is an 8-pin octal. This socket and plug combination for the rear panel is an 8-pin Octal (Series 86) now made by WPI. (The ninth pin is NOT a pin, but actually the alignment keyway)

I am looking at January 2005 QST, that shows Stu Cohen building the ARRL Ranger II kit (Figure 7 page 42) and I am also reading the parts list from a copy of the Ranger II assembly manual (BAMA).

Correct it is the 8-pin Octal (Amphenol/WPI series 86) VERY COMMON and still
being mfg.

No, its an 8-pin. The 86 series has an alignment keyway in the center
(which is not energized - and does not count as a pin). Readily available,
being mfg. everyday in Salem, NJ.
Here is WPI catalog (look at Section 4 for diagrams and options for 86
series plugs and sockets)
http://www.wpi-interconnect.com/Catalogs/WPICatalog/WPI%20catalog%20PDF.pdf

Dick, are you referring to J6 ??

An 8-pin Octal, then this is readily available.

IF you need the PLUG for a 9-pin tube socket chassis connector -- then this is identical to the external VFO connector used by Kenwood and available from Kenwood (East Coast) parts (RF parts use to have them - but sold out last year).

E05-0901-05 TS-820 9P VFO PLUG TS-520 $5.04

East Coast Parts
2 Marlborough Road
West Hempstead, NY 11552
Toll Free USA: 800-645-3516
Toll Free New York: 800-632-3323

I do have 2 of these connectors in my parts bin.

The Ranger, Ranger II, and Valiant schematics all show a nine-pin
connector. The connector I just pulled off of my Ranger is a nine-pin
male plug.

I believe that that settles the matter.

But I agree that they are not rare; I can find them in lots of places.
I have several myself that I bought just 'cause (they were cheap, too).

If you want to talk about a hard-to-find connector, let's track down
some of those furshlugginer four-pin "microphone" plugs that Johnson
used for bias control on the Thunderbolt and power supply to the SSB
adapter on the Valiant II. Would LOVE to find some of those! Same pin
pattern as the insert in the large Amphenol microphone connector (used
by Motorola and early Heathkit) but with a tin backshell.

regards,

Mahlon - K4OQ

I just pulled the plug off the back of my Ranger II, and it is also
a nine pin (of the type which at first glance looks like an octal).

My question is: what connector fits the antenna relay power socket
on the back of the Ranger II? It looks like an HC-6 crystal
would fit it, but it doesn't.

Thanks,
Ed Knobloch

Mahlon -

I believe that Amphenol connector series (microphone) was also handed over
to WPI (Salem, NJ operations), you can always check the catalog or give them
a call (they also handle a large number of military and specialized
connectors).
http://www.wpi-interconnect.com/Catalogs/WPICatalog/WPI%20catalog%20PDF.pdf

Yes, Amphenol 86 series.
http://store.yahoo.com/triodeel/amphenol.html

11 pin was used by relays and for power supplies, such as the Heathkit HP-23
for the SB series of radios.

6 pin socket & plugs are the ones normally used with older Leslie speakers
(like 147 & 122) with tube amplifiers, that attach to Hammond organs.

8-pin was the popular octal used for a number of subassemblies, relay
sockets and cables.

And how is that a successful strategy for THEM? Doesn't somebody else then just bid a minimum increment over them, and now they aren't the winner either? So then they have to go back and bid up again, till they are the high bidder once again.

This technique may harass bidders and inflate the auction price, but it's not a way to win. The winner, despite having an unknown high bid, ALWAYS wins by just the minimum increment.

The snipe strategy is just the opposite, Ed;
snipe bidding at the last minute substantially reduces final prices.
In a non-snipe environment, two bidders might proceed thus:

#1 thinks: "My absolute maximum for this is $50 and bids accordingly.
It is 3 days until auction close.

#2 decides $60 is his highest offer, and he bids.
It is 2 days until auction close.

#1 sees he is outbid at $51. He says "Oh, well." But that is not
the nature of humans. He frets. He figgits. He finally convinces
himself: "I really want this. If it's worth $50, it's worth $70."
He bids $70 and becomes high bidder at $61.
It is 1 day to auction close.

#2 now does exactly the same thing #1 did,
and is now the high bidder at $71.

In the last few hours, this cycle repeats until #2
actually reaches his (heretofore unconscious) limit of $95,
and #1 wins the auction at $96.

In a Sniped auction, #1 says "My limit is $50" and puts in his
snipe accordingly. #2 says his is $60 and puts in his snipe.
The auction closes with #2 the winner at $61.

Therefore, sniping actually brings prices down overall.

The wise sniper will use the long time before auction close
to think hard about just how much he wants an item,
instead of entering his first impulse
six days before auction end.

Kindly,
David S.

p.s. There is one reason for entering an early bid:
I sometimes enter a low bid just to put my name on the

list and let my friends know I'm really interested in
that item. This gives us a chance to negotiate
about which of us is going to actually try to win the item.
The other person can drop out of the race.
If you decide to use this idea, you and your friends
need to exchange emails about your Ebay user IDs;
don't expect your best friend to know "GoobaWappa6"
is you, unless you tell him.

Maybe I'm very atypical, but I don't get much smarter in any six-day period.

136. WTB Lafayette KT-200 Assembly Manual

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-08 22:12:03 UTC
From: WB8ICT <WB8ICT@verizon.net>
Message-ID: <TUYDd.1728$hc7.340@trnddc08>
Source record: 20125

I am looking for a factory assembly manual for the Lafayette KT-200

short wave radio. This was a partially assembled kit from Lafayette.

I especially need the pictorial drawings that shows parts placement

which was a separate insert sheet as I have already purchased the

assembly and operations manual from an online manual vendor

which did NOT include this pictorial insert.

This was the kit version of the Layfayette HE-10 Short wave

radio which was sold from 1959 to 1963 and looked a

lot like the Hallicrafters S-38 series only bigger.

I would also consider a working or non-working HE-10 radio.

Please send details and price.

A 10% increase in line voltage will affect the hv secondary but not the
filament voltage as you mite think. See below.
120 line X 10% = 132
750 hv X 10% = 825
6.3 filament X 10% = 6.9 Still within the ballpark.
Note, most all transformer filament voltages are not what you mite think
they are. For instance, 6.3 volts could be as much as 7 volts, 13.8 could be
15 volts, 5 volts could be as much as 5-1/2 volts. This also holds true with
hv secondary. Line voltage fluctuations affect the transformer outputs,
before any regulation.
My two cents.
Gary

From: COLIN LAMB <k7fm@teleport.com>
Message-ID: <A_bEd.2307$li4.2077@newsread3.news.pas.earthlink.net>
Source record: 20136

Collins designed the 516F-2 for voltages less than today's typical line voltage. This is because a certain minimum voltage is required for good performance, and Collins wanted good performance even if the line voltage was less than what we now consider normal (110 volts or 220 volts). The specified voltages were actually a "minimum" voltage rather than nominal.

Line voltages were slightly less when the 516F-2 came out. And, tubes were much cheaper.

Today, tubes are much more expensive and difficult to obtain, so it is important to not exceed the voltages to provide maximum life for tubes.

I built my own substitute power supply for my KWM-2A. Although I have solid state rectifiers, I have a timed delay to allow full warm up of the tubes, prior to application. And, I monitor the filament voltages and use a step-start. The result is that I have not had to change a tube in my KWM-2A in about 25 years, even though I used it daily for almost 10.

The Ocean Hopper was a constantly evolving product. I would not doubt that
76s were used in some year or other. I would expect that everybody here has
given truthful answers. There are just many of them!

From: kludge@panix.com
Message-ID: <cruh8o$93p$1@panix2.panix.com>
Source record: 20059

I have an Alliance four-wire antenna rotator, with the fourth wire providing a contact closure indicating end-of-travel. It's up on the tower and I do not really want to go up there and swap it out if I can avoid it. These require a control box with a motor in it that moves an indicator in synch with the rotator.

I have an Alliance four-wire control box. BUT, the control box is one of the older sort with a solenoid and ratchet. These boxes require a rotator that produces a pulse every few degrees of operation so that the control box needle is advanced in steps with each one. This box has recently been torn down and rebuilt, with a new capacitor and recent lubrication. The bakelite cabinet has been polished until it shines like a new dish.

These are not compatible. Anybody in the opposite situation care to exchange control boxes? Or someone with a stray control box care to sell theirs?

Differently from what you think, filament voltage must stay within a few percent from nominal as it is very critical for tube life You can be sure that Collins designed the transformer for exactly 5V on the rectifiers and 6.3V on the other tubes, plus /minus just perhaps one percent, when line voltage is nominal.

So, if I measure exactly 5V and 6.3V on the filaments, it means that my line voltage is OK. And I also have an accurate line voltage meter that witnesses that.

So, differently from what you think, the problem is that the RATIO between the transformer high-voltage and filament voltage, which appears to be higher than it should be

Colin,

from the various answers I receive, it seems to me that I am not able to explain myself well.

Let me put it this way. I have a variable transformer (VARIAC) and I adjust the mains voltage until I get precisely 5V and 6.3V on the filaments.

At that point the DC high voltages are both significantly higher than what stated in the manual. The transformer AC voltages are also too high and well matching the DC voltages, so the problem is not in the rectifier.

I was just asking whether someone has measured the 516-F2 AC voltages at nominal mains voltage.

Beware of a weasel selling under the name of Radios-n-Stuff.
His real name is Sam Chrisbens, N0KEI, of Divide, Co. I won
an auction for a Motorola amplifier on Dec 5th, paid Sam and
received a USPS tracking number. I checked the tracking number
several times but it showed item not received at Post Office.
I received an Email from him on the 30th of Dec saying the
item had been shipped but tracking number says differently.

This is the second time I've had issues with this guy. I
bought an HRO-5 from him a while back and it was received
damaged due to extremely poor packing. This was after I had
checked with him about the shipping and he had assured me that
he knew what he was doing and that the receiver would be packed
properly.

Apparently, Mr Chrisbens also deals in guns. I did a Google
search and turned up a few folks who are not very happy with
the way he conducts that business either!

> way??

Yah, there definitely is a stop at both ends. That is, if you try to go below the lowest band, or above the highest one, you hit a stop. My second set is in pieces right now, so I can't investigate.

There is a detent mechanism at the rear end of the bandshaft which might have a hard stop. Again, this thing is all over the workbench, so I can't say for sure. But that's where I would put a stop if I were designing a multi-band radio.

Below is a diagram for stringing the tuners. It mentions a blocking washer, and also says that you may break the cord if tension and knot position in the tuning is not correct.

http://antiqueradio.org/art/temp/SX28DialStringing.jpg

I can't testify that this information will be identical for SX-28 and SX-28A. Your mileage may vary :-)

From using my first SX-28, I have to say that the stop feels more mechanical (i.e., look at your detent assembly), not like hitting the end of a string. If your bandswitch turns smoothly from one band to the next, is it possible that somebody disassembled the bandshaft and left out some pieces, or forgot to tighten things down?

Regards,

Phil Nelson

I'm not an SX-28 owner or expert but it looks to me like it's a six
position bandswitch with 60 deg indexing. Why would it need a stop?
It seems it would be a lot better to just allow continous rotation
so you wouldnt have to go back through all the positions when going
from a high band to a low band.

177. Rules changes/enforcement at Dayton Hamvention

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-11 03:29:13 UTC
From: Mark@The.Toob
Message-ID: <pvh6u0p9pknegau5guitm5i7h0fu3gicf1@4ax.com>
Source record: 20066

This year the Dayton Hamvention has decreed that a maximum of two (2) vendor passes per flea market space will be allowed. As they do every year, they've also repeated the rule prohibiting trading or selling outside regular show hours...including setup day. The difference this year is it appears they may attempt some sort of actual enforcement.

I emailed them and asked specifically about these two rules. The query I sent appears below, followed by their response.

Those who may be contemplating getting a space this year, or are expecting to have a vendor friend get passes so they can get in on setup day, might consider emailing to the address at bottom to express their, er, opinion.

--Mark

********My query:
Please answer two questions:

1) Why do you have a rule against trading and/or selling at any time other than show hours? (I assume the rule also applies to Thursday, setup day).

2) Why have you limited people who have bought spaces this year to a total of two vendor passes?

--Mark

********Hamvention response:
Hi Mark..

Here's the deal on the two ticket limit...

We have found that there are simply too many people in the Flea Market area on Thursday, setup day, when people and moving vehicles are vying for the same space in the aisles. This causes our local safety officials, and our insurance carriers to get nervous about the possibility of accidents. As you know, we already have a pretty strictly enforced rule about no moving vehicles in the Flea Market during

the show open hours which is the result of these same concerns.

The second problem is that we have had many complaints about trading occurring on Thursday, which is prohibited by our rules. We do not believe it is fair to the 20,000+ visitors who must wait until Friday to get into the Flea Market to be unfairly disadvantaged by a portion of the 3000 vendors and friends who have had the privilege to get in early, and choose to not only break the rules, but to disrespect the greater number of potential customers who can't get in. I observed several instances of trading on Thursday last year, enough to convince me that corrective action was needed to create a level playing field for everyone.

Some of you have written to point out that you simply cannot set up yourspaces with only two people per space. My personal experience as a Flea Market vendor for many years is that more than two people PER SPACE simply get in each other's way.

The bottom line is that we have several requirements put on us in order to have a successful Flea Market, and this change is our way of meeting those requirements.

We hope you will see this as a path to a better, safer, and more fair for everyone Dayton Hamvention Flea Market.

Thanks for your understanding.

Regards,

Tom.

Yes, on a simpler radio that doesn't have a moving band pilot lamp or shadow indicator, you certainly could let the bandswitch rotate 360 degrees in either direction.

This stop is needed because the SX-28 has two string-driven shadow band indicators, behind the main tuning and bandspread dials, respectively. The indicators run on little elevators that can go up in one direction, and down in the other. When an elevator hits the top floor, there's only one direction to go, and vice versa :-)

The diagram at http://antiqueradio.org/art/temp/SX28DialStringing.jpg doesn't show all of the parts and pieces, but it does show the strings, springs, and major doohickeys that make it work. The crossbar carrying the main tuner shadow indicator is shown where an arrow points to C. The shadow indicators are simply bent pieces of flat metal with arrow shapes on the end, which create shadows by sitting between the pilot lamps and the tuning dials.

Looking at the diagram, find the main tuner bandshaft, where it says "connected to main tuning knob." If you turn the main tuning knob counterclockwise, to move you from a lower band to the next higher band, that will tighten the two sets of strings and lift the two shadow indicators upward on their elevators. Turn it clockwise, and it will lower the elevators one floor. But beyond the top and bottom floor, you can't go any farther without breaking the strings.

Lest you think this is over-complicated, my Midwest DD-18 (http://antiqueradio.org/MidwestDD-18.htm) has gizmos that move a pilot lamp up and down behind a red/green colored screen to illuminate the chosen bands on the tuning dial. A "Tunalite" circuit is fed off the AVC line and darkens/brightens the pilot lamp as you tune into a station. A lamp mask on the bottom half of the dial changes to illuminate the Wavelength markings accordingly. The good news is that the whole thing is gear-driven -- no strings to replace!

There are very few transformers out there that are rite on the nose or within a few percent. Collins is not one of them, I assure you. Secondary voltages are determined by the VPT (volts per turn) on the primary. Primary voltage varies and lets not forget frequency varies also. Being a transformer rewinder, I see allot of Collins stuff. The 516F-2 power supply was NOT one of Collins best attempts. They used what ever transformer was available and the cheapest, dollar wise. The vpt on the 516F2 is .44 volts. With 14 turns that equals 6.16 volts. At 15 turns that equals 6.6 volts. This is at no load. I have rewound several of the 516F-2 power transformer and NONE of them are "rite on".

Differently from what you think, filament voltage must stay within a few percent from nominal as it is very critical for tube life You can be sure that Collins designed the transformer for exactly 5V on the rectifiers and 6.3V on the other tubes, plus /minus just perhaps one percent, when line voltage is nominal.

So, if I measure exactly 5V and 6.3V on the filaments, it means that my line voltage is OK. And I also have an accurate line voltage meter that witnesses that.

So, differently from what you think, the problem is that the RATIO between the transformer high-voltage and filament voltage, which appears to be higher than it should be

It is IMPOSSIBLE to get "precisely" 5 volts and 6.3 volts at the same time.
What ever your using to measure these voltages says you are, but your not.
Gary
"Antonio I0JX" <vernucci@tin.it> wrote in message
news:7aAEd.667357$35.27034947@news4.tin.it...
Colin,

from the various answers I receive, it seems to me that I am not able to
explain myself well.

Let me put it this way. I have a variable transformer (VARIAC) and I adjust
the mains voltage until I get precisely 5V and 6.3V on the filaments.

At that point the DC high voltages are both significantly higher than what
stated in the manual. The transformer AC voltages are also too high and well
matching the DC voltages, so the problem is not in the rectifier.

I was just asking whether someone has measured the 516-F2 AC voltages at
nominal mains voltage.

Wikipedia has an entry for Tuned RF receivers that says EH Armstrong invented the Tuned RF receiver in 1918. I think this is wrong. Armstrong was in the throes of patenting the superheterodyne circuit at that time.

Hazeltine invented the Neutrodyne, but this was an improvement on the TRF circuit. Was it just one of those things that logically developed from wanting a bigger signal for the detector?

I have a copy of "The Electrical Review" from 1902 wherein
Signor Marconi is describing his experiments with "syntonising",
a means by which the station at Poldhu no longer interferes
with the station on the Lizard. It was clear from the article
(although I have not referred to it for several years) that he
is referring to tuned circuits.

We take many things for granted nowadays, but even the
concept of tuning was the subject of a patent in them thar days.

Message-ID: <9q2Fd.33143$TN6.1043720@news20.bellglobal.com>
Source record: 20082

Got a nice HQ-180 off of ebay. Works great except that the sensitivity
seems
off in the top band 15-30 MHz. Tried aligning it and I can either peak it up
at the low end or the high end but not both. Seems the tracking of the 2nd
RF
filter (the one after the RF amp) is off.

Is this normal ? If not any suggestions?

Cute, but I wouldn't have paid $100+ for it, either.

My website has an article (http://antiqueradio.org/smeter.htm) including original Hallicrafters documentation for adding an S-meter to the S38, S-40, etc.

Another article (http://antiqueradio.org/magiceye.htm) has instructions for building a plug-in "magic eye" tuning indicator for the S-20R. Same principle will work for an S-40.

Re: G & F Sales Company, Chicago -- 1930's Futuristic Wood Radio has been called the "Searchlight radio" by some or "Disk-shaped Radio by others."

I have one of these and am looking for any info. Please feel free to email me if you know anything at all about this radio or if you have one. Mine is missing a tube and I am trying to find out what it was. I also would love to know what value it has -- I have been told it is "quite valuable." It is a really funny a interesting design. Something from the 1933 Chicago or 1939 New York World's fair. It turns up and down and from side to side, just like the tourist quarter binoculars at the Statue of Liberty or Empire State Building. What I have been able to find is listed below. Thanks to all who have emailed me from other lists as well as from this list. There seems to be little or no info on these sets. It seems that it is very rare. I would love a copy of any articles or pictures from those cited below. I would also buy a schematic if there is such a thing on this set.

Please see picture of radio at link below or email me for picture:

Hi Chris,

I'm still researching.. Can you send me any information that is on maybe a metal plate in the back? The tubes you have in it 1-6A7, 1-25Z5, 1-75, 1-78 make me think it is not the General TV and Radio 5A5 as one of the below references say, as this chassis was made with post-war tubes like 12sk7, 12sq7 etc. I remember reading the article you copied in Antique Radio Classified a while ago, that's where I was trying to find (from the back of my mind) when you described it. I

then found a picture on the web. Thanks for the tube line up, that may help identifying it. It was most like made by one of the many shops in Chicago and then resold under a different name. By the way- it's quite valuable.. Where did you find it?

--- Chris Murray <mwmwmfilms@yahoo.com> wrote:
Subject: Re: Fwd: Re: Please help figure out what radio this is.

Hi Patrick,
I don't know if you got my other email but I am very impressed that you found it. Since you led me in the right direction I came up with these web citings. I really need to still find a schematic, a tube list if nothing else and a value would be nice. I only have 4 of the 5 tubes (1-6A7, 1-25Z5, 1-75, 1-78 missing the other it has a ballast marked triad and a 6pin tuning eye.) Below are all the excerpts that I could find on the web, I tried emailing to those mentioned but who knows if that will work.

Thanks for your help!
Best,
Chris Murray

Found on the web

==========
Disk-Shaped Radio Help ID
Dear Editor:

The unknown radio shown in your Photo Review, February'97, p. 13, and again in the March 1999 issue, p.15, is a General Television Model 5A5 "Spy Radio," ca.1938. It appears to me to have Detrola knobs, possibly made for the company by Detrola(?). I have this radio and mine has a sticker on the front saying "GF Sales Co., Chicago, Illinois."--Jim Hauskins, Bloomington, IL
==========
Dear Editor: In the March 1999 issue of A.R.C., a disc-shaped radio is shown asking for the identity of the manufacturer. I have the same radio. On the back is a metal plate with the following information: "Licensed under patents of Radio Corporation of America, General Electric Company, Westinghouse Electric & Mfg. Company, Hazeltine Corporation." There is also a sticker on the back which reads: "G&F Radio Patent applied for. For maximum efficiency for local and distance reception, add 15 to 25 feet of aerial. For foreign reception add 40 to 50 foot outdoor aerial." The serial number for this unit is 25-174958. I hope this information is helpful. --J. Melvin Isett, Huntingdon, PA
==========
Following these leads reveals an example in "Machine Age to Jet Age II" by Mark Stein on page 148. And yet another can be found on the cover of

the 1997 tube catalog of Electron Tube Enterprises, Essex, Vermont, which clearly shows the G&F Sales Company, Chicago logo on the lower portion of the disk. It appears that the mystery is now solved. (Editor)

Photo can be found at
http://www.antiqueradio.com/radiomisc04-99.html

My G & F sales, searchlight radio has 6A7, 78, 75, 25Z5 but is missing another unknown tube , it also has a ballast marked triad, and a 6 pin tuning eye.

Still stuck on the Searchlight radio

Subject: Still stuck on the Searchlight radio

Had no responses to my inquiry on the "Searchlight" radio nearly identical to the General Radio and Television model shown in "Evolution of Radio" book. The decal says "GF" in script, with a ???? Co., Chicago. Cant read the ????. The tube lineup is: 6D6, 6C6, 25Z5, 25L6 and a L55B ballast. Riders shows several models with a similar lineup, but the output tube is always a 43, not a 25L6. Do the Riders on CD do a search on tube complement? Their ads imply they do, but dont seem to be clear. Does anybody remember "GF" associated with a store or store brand in Chicago in the mid to late 30's?

In order to reply by mail, please change "davis" in my address to "david"

Thanks for any hints anyone might have.

Dave

I found 48 schematics in Rider's with the above tube compliment in 15 seconds using Gerald Larsen's handy dandy reference book "The Locator". This book is a tabulation of all of the schematics in Rider's listed in alphanumeric order by tube compliment. The listings are for radios up to 8 tubes and they are listed by tube number starting with the output tube(s), followed by power rectifier, then the remainder starting at the antenna and working towards the output. It covers Rider's 1 - 18 and covers A.C. powered sets only. This book was compiled out of the frustration of the author who is interested in off brand radios. He spent many hours thumbing through Rider's in search of schematics as well as other clues to the maker's of his off brand sets. He finally decided that it would make more sense to make an index by tube compliment than to go through all of Rider's looking for each new set that came along. The man hours of work to assemble this data probably was huge! For those of us who have spent many bleary eyed hours paging through The Mallory Radio Service Encyclopedia looking for a Rider's reference for a certain tube compliment, this is a fantastic reference. Should anyone wish to pusue this book, drop me a note end I'll send you the author's info.

Subject: Re: Still stuck on the Searchlight radio

The decal is black with gold highlighting; says "GF (or G&F) Sales Co. Chicago".You can get a copy of the ETE catalog at http//members.aol.com/etetubes.
It is an excellent color photo.
The owner says it's a General Radio mod 5.

Hope this helps Dave.

Dave Gonshor wrote:
> I've scanned Riders, Grinders and the price guides for info on this radio. It is in the shape of a searchlight. It is nearly identical to the General Radio and Television set pictured in "Evolution of Radio" book. The dial, knobs and decal are different. Everything else is identical. The tube line-up is 6C6, 6D6, 25Z5, 25L6 and a 55 volt ballast tube. There is no readable manufacturer's name on mine, but the front decal says GF ????? Co., Chicago. I'm trying to find a model number and a schematic (the chassis has been worked on which is why it has taken up the bad habit of smoking). Any help would be appreciated. Note my email has been modified

(change davis to david) to prevent junk mail. Thanks!

204. Re: Who invented Tuned RF receivers?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-13 01:09:53 UTC
From: Alan Douglas <adouglasatgis.net>
Message-ID: <j7ibu0pqj168rrh4g3t23cng5semng8hon@4ax.com>
Source record: 19994

Hi,
Ernst Alexanderson of GE held the controlling TRF patent, on the principle of inserting tuned circuits between successive gain stages. It was a rather obvious concept but as just noted, everything was patentable in those days. Interestingly, Sparton got around Alexanderson's patent by putting all the tuning at the front end, feeding a series of untuned RF stages.

Wikipedia is wrong. Howard Armstrong was indeed working on the superheterodyne in 1918:

Phil:
Yeah, it feels like you can turn it past the lower (or upper band) and go around again and break something. It feels like it's just the cord strength preventing you from continuing. I don't remember seeing those blocking washers but I will go inside again and look.

Thanks again Phil, your website has been a huge inspiration and source of information for work I have done on my 28. Now if I could just get that AVC working right......

A hard to find project box - N.O.S.
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5743172645

Still sealed in factory packaging.

Made of rigid 3/32" aluminum, the dimensions are roughly 7" wide x 6"
deep (front-to-back). The height is about 3" in back, sloping to about 1
3/4" in front. Two-piece construction, the side-bottom-side piece is
medium blue wrinkle, the back-top-front piece is a smooth off-white.
Bottom feet and attaching hardware are included.

Thanks for your time, and all the best in 2005,
theponyengine

Source record: 20008

Bill, that kind of performance is not normal for the HQ-180. How is the dial calibration on the 15-30 MHz band? Is the calibration good, but the sensitivity bad? If the local oscillator is off frequency, sensitivity will be poor and the calibration will be off. If it is just a sensitivity problem, then look at the RF stage. My HQ-180 dial calibration is very good on all bands. You should expect sensitivity and calibration accuracy on the "top band" to be as good as on the others.

Best Regards,

Ed

220. Issues in converting rectifiers ??

I'm curious about what is invloved in converting boatanchor (specifically my NC-125) power supplies from tubes to solid state bridge rectifiers. I understand that most guys will mount the bridge and dropping resistor on a tube socket so that the conversion is easily reversable. How do you determine the difference between (a) the voltage drop of the tube and the solid state bridge, and (b) the working current so that you can calculate the appropriate values of the dropping resistor and its power rating ??
Is there any point to converting the 6.3 volt filament string from from the ac bus, running all over the chassis spreading 60 hz hum wherever it goes, to 6.3 volt filtered DC, a rather easy thing to do these days. Has anyone done this ?? Is it worth it ?? what issues were involved ?

One approach...

Often the increase in B+ is not enough to fret over. But if you want to
do it "right" its a simple matter of measuring the B+ with the tube and
then remeasuring with the ss rectifier to see how much you want to drop.
Start by using say a 100 ohm, coupla watt resistor and you can
calculate the current draw and then calculate a final value accordingly.

This also gives the advantage of KNOWING the ACTUAL B+ current draw
which may point you to other problems the set may have like leaky caps,
too much audio tube current draw, etc.-

One Khz. is not bad for a radio of that vintage..How are you checking the freq.?Are you checking frequency in transmit condition? when you transmit in CW the radio may be designed to shift 1 KHz in freq.See if you can get more details ,OK. W4PQW

Source record: 20017

Regarding the conversion of vacuum tube rectifiers to solid state, I believe there are serious issues that need to be addressed.

I have repaired a number of Collins 75A4 receivers that had leaky mica coupling caps after a solid state rectifier is used. The reason is that the solid state rectifier puts out the full voltage prior to the vacuum tubes warming up. Thus, there is very little load on the power supply and the voltage soars to something around 500 volts, which causes the mica coupling caps in the if stage to become leaky, causing the grids to go positive and reducing sensitivity.

A second problem is that high voltage is applied to the tubes and current is drawn before the tube is warmed up. We do not do that to indirectly heated transmitter tubes, and for long life we should not do it to receivers, either.

The higher voltage is a secondary issue, although that can be easily solved.

I built a solid state supply for my KWM-2A. It has one minute delay prior to applying high voltage and all the voltages are within original specs. I have not changed tubes since about 1980, when I made the power supply, even though it was on daily for over 10 years.

DC on the filaments can be another long topic. There is some evidence that dc on the filaments will shorten the filament life of tubes, because the electron emission is off one end of the filament. Regular changing of polarity would reduce that problem. As to what that practical effect is, I do not know. A pilot light manufacturer rated some pilot lights for so many hours of use for military lighting. After most failed to come close to the life specifications, the manufacturer studied the problem and realized all the tests had been on ac rather than dc. When run on dc, the life was diminished.

I do not know of any studies that apply the same effect to vacuum tubes, but it probably does. However, very few tubes fail because their filaments fail, so maybe it is not a big issue.

However, a number of things can be done to reduce the hum, when using ac - such as applying a dc bias to the filaments, which are otherwise isolated from ground, or grounding only through a ct transformer and have both sides of the filament above ground.

I won't dispute your findings but if the caps are bad (leaky) they
should be replaced as a matter of course in refurbing. The higher
voltage wouldn't appear to *make* them "become leaky". There's better
ways to check them rather than "smoke test".
The adages from the old days that "mica caps don't go bad" are falling
to the wayside these days. They may not be as circumspect as a paper
cap but the failure rate nowadays is becoming more than negligible. I
don't trust them anymore in a 50-60 yr old radio but I haven't reached
the point of shot-gunning them like paper caps. I suspect that the time
will soon come where that is an efficient way of dealing with them. In
the meantime, Q-challenged circuits will simply have to deliver poor
performance due to leakage until the hapless 'restorer' sees some real
visible sparks flying to believe there is an issue with these old boys.

Other comments well taken, I have in the past simply dropped in the octal, solid-state replacements into various equipments without any undue effect(s)... or so it would appear. Having said that, I no longer convert to solid state, nor build up power supplies for older/surplus equipment without the ability to turn-on filaments first. The original tubes are still cheap and readily available. What I have found is that if I run my vintage equipment at the rated input voltage (typ 110v) via variacs in my distribution bus, I do not have the heat problems I did when simply plugging them into my house 125v service, directly. The heat difference was quite amazing!

Most rectifier tubes have directly heated cathodes and warm up in a
matter of seconds...way before the other tubes with indirectly heated
cathodes warm up enough to draw current. Other than a reduction in
inrush current during the rectifier warmup, you will have the same
problem with tube rectifiers. A possible solution is the use of a
NTC thermistor in the AC line.

Roger has a good point about the warm up time of most rectifier tubes, although I have found the delay is a matter of seconds and helps a lot.

For better protection, it is easy to substitute indirectly heated rectifier tubes for the 5Y3. The 5V4 and the 5Z4 are two tubes that can be substituted - although it is important to verify that the output is taken from pin 8.

The 5AT4 may be substituted for the 5U4 in many cases, but be sure to look at the specifications to confirm it will work. I recall that Eico used the 5AR4 in some of the ham rigs, but the tube manual I grabbed does not have that one.

We used to consider mica caps as "forever", but the smaller ones are now fair game.

Why would you want to use a solid state power supply in the first place.
The original power supply is not as efficient but unless you are operating
from batteries the extra 10 watts or so will never be noticed.

Thanks for the replies so far.

I am testing with a HP lab quality signal generator so it is not band conditions.
Frequency calibration seems quite reasonable acroos all the bands.

Found a couple of things today:
In the RF amp circuit,
R2 was only 100 ohms instead of 1K.
C7 at the non V+ side of R2 was not connected to ground.
- Fixed these but didn't seem to make much of a difference

Found that grease from the bearings of the main tuning capacitor had gotten onto the rotor contacts at the front. I noticed this because when I jiggle the main tuning knob by accident, the signal level jumped.

I think the mixer and following circuitry is working ok.
Removed the RF input lead to the mixer and directly injected the signal from my signal generator. With a source of 50 ohms the S meter read S5 across the top 3 bands. When I injected the signal through a 1 K resistor the signal level dropped as a function of frequency.

I will continue to focuss on the circuitry around the RF amp and possibly cleaning up the switch contacts. I tried swapping tubes but that made no difference.

Nice radio though.

That is true. You can just barely see those twin half-moon dials in one of the photos in the book.

Though you have to wonder how many A and B batteries it took to run that set! Bet there was no other "ballst" on that big raft.

Most pre-war Hammarlund rx manuals have diagrams showing how to hook up batteries. Yep, a 20-tube Super-Rpo 400. Wonder how many minutes it could run like that? --Mike K.

I restored one of those Sparton radios, and it works very well -- every bit as
selective as any other 4-stage TRF AM-BC set of the time.

I also have a spare tuned front end from that project, which I keep intending
to use as a "secret weapon" preselector ahead of a modern AM rx for BC DXing.

ISTR that Tesla invented the notion of tuning an RF transformer by adding a third winding and tuning that to resonance, rather than try to tune the very low-impedance primary (a half dozen turns) or the high-voltage secondary of his Tesla Coils.

I *suspect* that some Grundig tube radios get their selectivity and sensitivity out of hardly any stages, by using tertiary resonant windings a la Tesla in their IF transformers, along with the usual tuning of primary and secondary.

Gee, what was there to align? Maybe a trimmer that controlled the dial
calibration? I'm thinking of a regen set, kick me if I'm wrong.

One of the nicest things about these sets, was nothing to align!
I have a working Ocean Hopper upstairs, and maybe a Span Master. The Hopper is
VERY sensitive, but I have only the BC Band coil.

Does the antenna trimmer work properly? That is, do you get a sharp peak in the response when it is adjusted? If the antenna trimmer works across the band, then the antenna coil is OK. My HQ-180 had a broken wire in the cable coming from the trimmer cap.

Best Regards,

Ed

I'm pretty sure the Star Roamer was a cheap superhet. But it can be
difficult to keep track, when there is a certain resemblance between its
name and "Ocean Hopper" and "Span Master".

What kind of device is it? It may well have an internal rectifer and
you could simply tap in with DC after that point?

Unless you are in a car or mobile (and a battery is your only power source),
a standard filament transformer (120 VAC to 12.6 VAC) will do the trick
(available at Radio Shack). There are also inexpensive wall-warts (new and
surplus) that actually supply 12 VAC to SOME devices, although a majority
are 12 VDC

Hi, I have a device that requires 12vac but need to use 12vdc as a source. Is this possible? I see all kinds of 12vdc inverters around but they all provide 120\240 vac
Been looking high and low and can't find a power supply or inverter on the market that will do what i'm looking for. Starting to think its not possible. I guess something like a variac off the power inverter might drop the voltage down from 120vac to 12vac but thought there must be some other way. Also tried looking for a "variable" dc to ac inverter but they dont seem to exist either. I need under 1 amp on the 12vac.
thanks

Depending upon the type of load, you could make an inverter out of a
60Hz oscilator and a cheap car stereo amplifier. This would not work for
a large motor such as a drill or mixer due to heavy startup drain,
but a small motor such as a clock, old tape recorder/vcr, telescope
positioning unit (clock drive) etc would do fine.

The trick is to get a good 60Hz sine wave. Besides an resistor/capacitor
oscialtor, which would be fine for most things that are not truely
time critical, you could do a digital thing with a multiple of 2 such
as 32768kHz (common clock/watch frequency) and a counter circuit to
cut the pulses down to one every 60th of a second. You would then need
to smooth the square waves (pulses) into sine waves and then amplify
them to your 1 amp at 12 volts.

Geoff.

An inexpensive approach is to use a $29.95 inverter, purchased at one of the auto parts stores on sale, then use a 120 v to 12 volt transformer. That will give you what you want for about $35 - and give you 120 volts in your car for other things.

You could build you own inverter, but at that price it is hardly worthwhile - unless you need smething smaller.

You still haven't answered the question about what you want to run.

If it's for an audio application, it's probably because the device is
producing a bipolar supply inside, for +/-15V op-amp circuits. And it
is probably somewhat sensitive to supply input noise, if it is typical of
typical consumer-grade audio gear.

The antenna trimmer works fine. The first stage of RF filtering works well
across
all the bands. The antenna trimmer obviously helps here as it is just a cap
in parallel
with the tuning cap. My problems seem to be coming from either the RF
after, or the
following tuned circuits/switches.

Did have a damaged primary coil on one of the input transformers though,
T16. It was fried.
I wound 2 turns and this fixed it.

263. DO YOU WANT TO OBTAIN MANY DOLLARS?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-16 21:10:34 UTC
From: darting@latinmail.com
Message-ID: <e12fe651.0501161310.36574dfe@posting.google.com>
Source record: 19952

YOU WANT TO OBTAIN MANY DOLLARS ?
I've been trying to figure out the way to make extra money in the internet, checking news groups and ads. It's not easy but I try to keep an open mind to opportunities. In these websites you would find messages like the one described further below. The message got me thinking:This is just a chain, I don't buy it. But, what if it works? It's not something new. People have been doing it for decades and I've never heard of anyone that have acctually made some money out of it. But, what if it works? When you really think obout it, this is a real job. I finally made up my mind and here I go. If you made up yuour mind too, or if you're still giving it a little more thought, keep reading. It won't be easy. Putting this message on every single website that you can think of, like news, newsgroups and ads will be necessary. The more you do it, the better for you (and for me too, of course), that's why it's a real job. It'll take several hours of advertising and promoting.
This chain is different because it doesn't deppend on five or ten persons to whom the masseges would have to be sent by tradditional mail. With the internet, the message is sent worldwide, available to thousands and someone (like me) it's going to go for it. Finally, did you think how much you're going to learn from this kind of task so you can use this knowledge on future jobs or projects?
Now my name is the last one on the list, where, if you decide to go on, you'll put yours at the end leaving my name as the one before last. I wish you good luck, because part of this luck is for me too.
This is the message I found:
"A few days back, when I was visiting news websites, just like you are now, I saw an article, very similiar to this one, saying you can make thousands of dollars in just a few weeks by investing only US$6ï¿½ï¿½! I thougt: "Oh no! Another fraud?" But just like most of us, I got very curious and I kept reading. The article showed six names and addresses for you to send US$1ï¿½ï¿½. Then, you have to write your name at the end of the list replacing the one on #6 and send the article to at least 200 "newsgroups" (there are thousands of these all around the world). There's no trick, that was it.
The big difference between this chain system and others is that you have a list of six members instead of five. This means that your average proffit will be fifteen times higher!!! After thinking it through with my friends, I decided to give it a try. After all, I had nothing to lose but six stamps and US$6ï¿½ï¿½, right?
I was worried about the whole thing being legal, so I contacted the Correo Central de Chile and they confirmed this chain is completely legal!!
So I invested my US$6ï¿½ï¿½.....GUESS WHAT!!!... seven days later, I

started to recieve money by mail!!! I was really surprised!!! I still thought this would end in a few days, but the money kept comming!!!
The first week I made from US$20ï¿½ï¿½ to US$30ï¿½ï¿½. By the end of the second week, I had made a total of US$1.000ï¿½ï¿½!!!!! By the third week I got more than US$10.000ï¿½ï¿½ and I was getting more. This is my fourth week and I've made over US$41.000ï¿½ï¿½ and It's still comming (my family spend the time opening the envelopes and I spend my time finding "newsgroups"). This is getting serious!!!
At the end, it really paid the US$6ï¿½ï¿½ and six stamps investment. I sure spent more on lotto!!!
Let me explain how it works, and most of all, the reason why it works so well. Make sure to print a copy of this article RIGHT NOW so you can get all the information needed.
It's a very simple 3 step process:
STEP Nï¿½1: Get six pieces of paper and write this down on everyone: "PLEASE INCLUDE ME IN YOUR ADDRESS LIST OR E-MAIL." Now get six US$1ï¿½ï¿½ bills. Then, fold the papers and put the one dollar bill in each so it won't be seen through the envelope. It'll be better if you cover the bill with a dark color paper so it won't be stolen. At the end you'll have six sealed envelopes with six one dollar bills enclolsed. By doing this you're creating a "service" which makes it ABSOLUTELY LEGAL!!!
Send the envelopes to the following addresses:

1. Oscar Javier Rodrï¿½guez z
CR 31 # 45 - 23 barrio el triunfo, Villavicencio Colombia

2. Jorge Balcï¿½zar
Convento San Juan de los Lagos Nï¿½ 36, Jardines de Santa Mï¿½nica, C.P. 54050, Tlalnepantla, Estado de Mexico, Mï¿½XICO

3. Marco Vinicio Gramajo Leal
2a. Avenida 4-66 Zona 1, Mazatenango Suchitepequez, Guatemala, Centro Amï¿½rica.

4. Ricardo Portillo Arteaga
Calle Gonzalo de Berceo Nï¿½ 52 piso 2ï¿½ letra B, codigo postal 26005, Logroï¿½o - La Rioja, Espaï¿½a.

5. Javier Piï¿½eros Barreto
Carrera 72 No 62 f 33 sur, manzana 2 entrada 3 apto 102, Urbanizaciï¿½n Calabria, Bogota Colombia,

6. JAVIER DARIO ARENAS
Apartado postal : 243003
ADPOSTAL: Palmira - Valle Del Cauca - Colombia
Email: adarting@hotmail.com o darting@latimail.com

STEP2: Remove name #1 of the top of the list and move the other names one number up (#6 becomes #5 and so on), add your name and address as #6. REMEMBER, YOU MUST REMOVE #1 NOT #6, MODIFY THE NUMBER ON THE REMAINING NAMES AND ADD YOUR NAME AND ADDRESS TO THE LIST AS #6.

STEP3: Change all those things you consider to be changed in this article, but try to keep it as close to the original as possible. Now put your article on at least 200 "newsgroups" (there are more than 24.000 groups). Just search in google.com by the keyword "newsgroups" and you'll find more than 56.000 items. You just need 200, but the more you put the article on line, the more money you'll get!!
These are instructions to get into the "Newusgroups":
Nï¿½1 Since you must have your own article, there's no need to write it all over again. Just select the whole text and use the "copy" function from the "edit" menu.
Nï¿½2 Create a "notepad" file and "paste" the text, also using this function from the "edit" menu. Now you have the text as a notepad file and you can add your name and address as #6.
Nï¿½3 Save the text as a .txt file. This will make It easier for you to make chages on the text whenever you want.
FOR THOSE WHO USE NETSCAPE
Nï¿½4 In the Netscape browser go to "window" and select "netscapeNews". Then, select "options" from the menu and then selct "show all Newsgroups" so you can get the list of all the "Newsgroups" in the server. Click on any of the newsgroups, and then click on "TO NEWS", it should appear at the top on the left. This will lead you to the messages box.
Nï¿½5 Fill in that space. That will be the title everyone will see when visiting any group.
Nï¿½6 Copy your article and paste it there. Go back to the Newsgroup and "TO NEWS" and you'll be creating and pasting inside the program or "posting".
Nï¿½7 Click on "send" AND YOU'RE DONE!..CONGRATULATIONS!!
TO THOSE WHO USE INTERNET EXPLORER
Step Nï¿½4 Go to Newsgroups and select "Post an article".
Step Nï¿½5 Load the article
Step Nï¿½6 Repeat step Nï¿½6 for the Netscape users.
Step Nï¿½7 Press "Post"
THAT'S ALL! All you have to do is search for different Newsgroups. After a few loads, It'll take like 30 seconds to put the article in each newsgroup!
Eventually you might want to get a P.O Box ‘cause you're gonna get a great ammount of envelopes. You can also use a nickname as long as the address is correct. MAKE SURE THAT ALL THE ADDRESSES ARE CORRECT.
Now, let's check the numbers:
Supose I only get 5 answers out of 200 sent messages (which is a really low example), then I made US$5ï¿½ï¿½ with my name as #6 on the list. Now, if everyone who sent me US$1ï¿½ï¿½ contact a minimum of 200 Newsgroups too, all of them with my name as #5 on the list, and just five answer to the 5 original messages, I'll get US$25ï¿½ï¿½. This 25 persons put my name as #4 on a minimum of 200 Newsgroups getting just 5 answers I'd be makin another US$125ï¿½ï¿½. Then, 125 persons put my name as #3 on a minimum of 200 Newsgroups, again getting just 5 answers, I'd be getting another US$625ï¿½ï¿½ and so on!! With my name as #2 I'll get US$3.125ï¿½ï¿½, and as #1, US$15.625!!!

Now, as I said before, getting only 5 answers is extreeme, the real average of answers is 20 to 30, so DO THE MATH!!!
Once your name is out of the list, get the last ad on the newsgroup and send the US$6ï¿½ï¿½ to the names listed and put yours as #6 and start all over!!
Just remember: Thousands of people all around the world surf the Internet every day reading the article just like you and me! So I think many of them wont see a problem on investing US$6ï¿½ï¿½ to see if it really works. I know that some will think, "what if no one answers?" No way!!! What are the chances that will happen, when there are millions of honest persons (like us) who need to pay bills, who are looking for financial independence and who are willing to give it a shot.
You can also do this by getting at least 200 e-mails. With this system, the probbability of success is 5% to 15%. Eather way you do it, always remember to be honest and I promaise you It will work.
Just make sure to print this article NOW. Try to keep a list to track all those who sent you money. Keep checking the newsgroups so you can see if everyone is playing fair. REMEMER, HONESTY ES THE BEST WAY TO GET WHAT YOU WANT. I've heard of people who sent the message with their names on the list but without sending the money and they hardly recieved any money back.
TIME IS IMPORTANT! Don't wait more than seven days from the moment you see this article! Let's follow the rules so we can all win! Don't forget to mention this extra money on your tax declaration. THANK YOU AND GOOD LUCK!

"Any idea how clean the output off the transformer would be? How clean is the output directly off a power invertor. The 12vac that i need is for an audio application."

If the power supply is converting back to dc, it should not be a problem.

The only time it would be of concern is if something gets into the audio section by transfer outside of the desired path. I would try it and you will probably find that it is fine.

I have used miy inverter for various projects and never found that the less than perfect sine wave caused any problems.

The stereo generator likely takes it to a rectifier / capacitor inside the
unit to produce DC anyway ..
you could tap (and feed 12 vdc) beyond the rectifier (and maybe capacitor) -
if it was a straight 12 vdc conversion.

Hi all,

I've heard and read a lot of discussion on the "problem" of the
B+ being applied before the tubes can warm up. However, plenty
of tube-type HF rigs came from the factory with solid-state power
supplies: Drake, Swan, Heath, National, Galaxy, et al. Did they
do something to make their gear more tolerant? Just curious.

If you need accuracy an alternative is to install a small cap (~10 pf
or less) connected to the plate of the tube and connected through,
say, a piece of RG-174 to a BNC jack. That will let you connect a freq
counter for accurate determination of the 90651 frequency.

Hi Dale. Great idea. I was thinking that I no longer have a portable freq counter - only a lab model - then remembered that my MFJ-259B has a freq counter mode. I just set up the Millen next to the MFJ with a 1' whip and was able to read the Millen frequency all the way up to 300 MHz just by getting within a couple of inches of the Millen coil. Your idea would give me a bit more flexibility and there's already a small hole in the side of the Millen cabinet (factory hole) that could be used for the cable exit.

There's really no reason why the Millen analog scale couldn't be made to read out at 1% or better accuracy. I'm going to remove the dial scale and scan it and then relocate the index marks to be accurate. The corrected scale will then be transferred to a new dial sheet and installed in place of the old one. Sounds time consuming, but bound to be faster than screwing around with those immovable trimmer caps and more accurate in the end.

Thanks for the idea.

Source record: 19972

If you anyway wish to replace the vacuum rectifier with a solid state one, using a voltage dropping resistor is a silly way to go, as it would impair the power supply regulation.

My suggestion is: after measuring the voltage increase you have with the solid state rectifier, just put an appropriate zener diode in series with the DC line. The zener diode causes a fixed drop and does not impair regulation.

If, for your application, a high-power (and hence expensive) zener diode would be needed, then use the well-known zener diode emulation circuit (a power transistor and a small zener).

One of the better receivers (Racal RA-17) also has a solid
state power supply with no means of delay.

**** OK I'm nitpicking but the Racal RA17 was designed for the British Navy
and was fitted with a GZ34/5AR4 vacuum tube recifier as were a number of
other variants such as the L etc.The model designed specifically for the US
market was the RA17C and its later variants,the RA17C-12 being the most
common.These used solid state power supplies as you wrote,and did not have a
B+ delay fitted.

Any picking of my nit will be appreciated!!! :-)

Brian Goldsmith.

"Antonio Vernucci" <vernucci@tin.it> wrote

If you anyway wish to replace the vacuum rectifier with a solid state one, using a voltage dropping resistor is a silly way to go, as it would impair the power supply regulation.

My suggestion is: after measuring the voltage increase you have with the solid state rectifier, just put an appropriate zener diode in series with the DC line. The zener diode causes a fixed drop and does not impair regulation.

If, for your application, a high-power (and hence expensive) zener diode would be needed, then use the well-known zener diode emulation circuit (a power transistor and a small zener).

***In the vast majority of receivers that I have come across,the power supply loading is more or less constant,the main drain being by the audio output stage which is almost universally a class A amplifier.Hence power supply regulation is
of no consequence as the load is static.Fitting a resistor will drop a constant number of Volts,try it and see.

Hello Floyd:

Years ago, I decided to convert one of my Millen tube jobs to a solid state one, using the article in QST. It was an exercise more to see if I could do it than any other reason.

When I got done, the 2 highest bands were off calibration. Sounds just about like yours. After looking at the options, I decided to simply make new scales for those bands. I did it by hand and the result looks quite good, although the paper is whiter than the original background.

This is what ham radio is all about. Now, I suppose I will get death threats for converting a perfectly good Millen dip meter to solid state. The tube version is more sensitive, but I do not need an extension cord for the solid state version.

Personally, I think the 90651 in its original condition is one of the least practical grid dip meters around. It's big, heavy, and you need two hands to use it. On top of that, it is not that sensitive, and the sensitivity is not adjustable! If you want a real instrument, get a Boonton/Measurements Model 59.

Unless yours serves as a shelf queen, I think any modification is an improvement! Go for it!

I don't recall ever seeing that QST article - perhaps you could tell me when
that was. Creating a new scale occurred to me as well and that may be what
I end up doing. I can remove the current scale, scan it into the PC, and
relocate the index marks with a graphics program. Then reprint it on film
or whatever and no one would know the difference. On my highest coil range
(up to 300 MHz,) which I would likely never use, the scale is on the button
over most of the range, with readout that's accurate at 1% at 300 MHz.

That's because the inter-electrode capacitance of the tube is part of
the tuned circuit.

The Measurements 59 is a great little GDO. Two things you must be
aware of, though: First is the coil sets are all slightly different
in terms of their stray capacitance and inductance. As a result each
set is serialized to the 59 frame it belongs with. The second is the
frequency tics were hand penned onto the dial during calibration.
Don't try and clean the dial!

> It looks like Tom's personal opinion is interfering with
> his ability to do his job.

With respect to and of the Dayton Hamvention, such rules, or lack thereof, are why I look forward to the Shelby, NC hamfest on Labor Day weekend each year.
It is a busy, busy hamfest, and the grounds are open 2 weeks prior to the actual 'Fest to allow people to obtain flea market space. The flea market is on a fairgrounds and basically open air. Spaces are available on a first-come, first-served basis. One picks out his space(s)--a maximum of 4 and picks up the little numbered flags and takes them to the 'fest headquarters on the grounds and gets his tickets. On the week prior to the actual weekend people are already arriving to set up campers and tents, and by Wednesday, the hamfest is unofficially underway with trading and dickering in full swing. By Friday as people continue to arrive, you can't tell it from the "official" hamfest! The atmosphere is friendly, exciting and everyone seems to have fun. On Saturday, you can't stir 'em (the crowds) with a stick! About the only restrictions are on the use of golf carts--only handicapped may use them during the actual hours of the 'fest.

I am somewhat puzzled at the Dayton 'fest and restrictions on free trade. Why hamper the free trade between those who can be there? Is there some jealousy of those who are not tied down to a 9-5 job?

I mean no disrespect to the Hamvention's policies, and I realize their situation is certainly different from that of a rural fairgrounds. Once in my life, I hope to visit the Dayton 'fest, but I wouldn't be all that happy as a flea market vendor IF I wanted to trade, etc.

I am not associated with the Shelby folks, but they have a very nice hamfest that has been going on for 50(?) years. So if you have never been to Shelby, NC, I would suggest you come. The atmosphere is relaxed, friendly, food is reasonable and plentiful, there are acres and acres of tailgate space (it fills up rapidly the week before), there are few, but reasonable restrictions related to safety and local laws, and you can trade to your heart's content from the prior Monday before until the grounds close late Sunday evening!!! People come every year from Florida,
Georgia, Tenn, Mississippi, Illinois, and Michigan--to name a few--and remain for the entire week if they like. Plenty of RV hooks and camping/tenting space. There's table space in several buildings, and covered space in the cattle barn. Come see them next Labor Day!

I don't know if the poster was referring to it, but QST ran an article
in a December issue, I think 1972 but it might have been 1971, by someone
from Millen about their work on making a solid state version.

They used the same coil set and tuning capacitor, though I don't recall
if they changed the dial.

It was not a conversion article, not a construction article, but about
what they needed to do in order for the solid state version to put out
a flat output, with few false dips. It was interesting to read, at the
time.

Source record: 19986

What you say is specifically true for receivers; it is obvious, no reason to try and see it as you suggest. But that is not true in the general case (e.g. transceivers).

Moreover, using a resistor, voltage will only drop only once tubes will have warmed up and drain current. With a zener instead voltage will immediately drop (e.g. any minimal load caused by an high-value resistor anywhere in the circuit will be sufficient to have the zener dropping voltage).

In some cases it is important to NEVER reach a voltage higher than specified. I had a bad experience at that regard with 6146Ws fed by a Collins power supply where the vacuum rectifier had been substituted by a solid state one. Two new 6146Ws immediately flashed and were damaged. A zener diode solved the problem.

Yep. A few years ago, I put my maximum proxy bid on a Racal receiver. Nobody beat my bid after a week. The seller told me he figured my high initial bid scared others away. At least they didn't come around for the last-minute feeding frenzy.

Nice radio, too. I plead seniority on the model number (6217?), but it's the transistor Wadley-Loop model with the odometer style freq readouts and purely analog tuning, and only a couple inches high in rack-mount. Sits under my RA-17C.

Not too surprising. I'd bet the same applies to accessories for any RX that
was sold with *optional* S-meter, xtal calibrator, clock, etc.

I'm thinking of the Allied Radio Knight R-100 rx, and the various Hammarlunds
with clock options. Though I doubt a clock movement would cost quite as much
as a good HQ-180.

And I thought I was the only one using this "mature" method :-)
OK, I confess, I've come back and upped my bid a couple of times, but usually I put my maximum in by proxy the first time. If I come back later and up my bid, it's cuz I've done some research and decided that my tentative initial bid was too low.

I do get a kick out of eBay buyers who use robot bidding programs and such, to win that last-minute bidding frenzy. Heck, that's the fun, at a live auciton anyway. I wonder if those 'bot users also use programs to watch and evaluate girls passing by, sample and rate fine Scotch, etc.? --Mike K.

"Antonio Vernucci" <vernucci@tin.it> wrote

What you say is specifically true for receivers; it is obvious, no reason to try and see it as you suggest. But that is not true in the general case (e.g. transceivers).

**** In the case of a transceiver using a vacuum tube rectifier I would expect the B+ to drop as the forward Voltage drop across the diodes increases with load.

Brian Goldsmith.

307. WTB: RCA Console Chassis

All:

I recently acquired an RCA 13K console. The speaker is present but the chassis is missing. I'm hoping someone here has a 13K chassis they would be willing to sell. I'd even take another speaker if I had to. Also, I was told that 15K chassis will fit into my cabinet. If anyone has either one of these two chassis's please send me an e-mail.

Regards,
Geoff

I'll second that. I've never been to Dayton - it is too long a haul for someone who is on call 24/7 (I'm a boatanchor buyer, not a seller), but Shelby is about a 3-1/2 hour drive away. There aren't quite as many boatanchors as there were several years ago, but there are still a lot of them. Shelby is considered by all the flea market fans that I know (and yours truly) as the best hamfest in the southeast.

Source record: 19899

"I don't know if the poster was referring to it, but QST ran an article in a December issue, I think 1972 but it might have been 1971, by someone from Millen about their work on making a solid state version."

You get a gold star on the memory test. It was December of 1972. I think it was titled "Anatomy of a Grid Dip Meter", and it was written by the chief engineer at Millen, who had led the conversion team. It is a worthwhile read for anyone who thinks of converting an rf device to solid state. In particular, the simple rf choke became a substantial barrier. The end result was multiple rf chokes and ferrite beades placed in just the right order to work at all frequencies. I recall Millen worked for days on the "simple" task of creating something that would work as an rf choke on all frequencies.

Here are a some items for sale. Prices do not include shipping. I will
ship overseas.

Hewlett Packard HP 331A Distortion Analyzer.....$100 plus shipping
Clean working unit. No power cord.
http://members.cox.net/radiostuff9/hp331a.JPG
http://members.cox.net/radiostuff9/hp331a2.JPG
http://members.cox.net/radiostuff9/hp331a3.JPG

General Electric TC-1 1930's Tube Tester.....$75 plus shipping
Neat art deco looking unit from late 1930's. It tests tubes from the
1920's to beyond the 1930's as it has some updated tube charts. It will
test 6L6's, 6V6's, etc. It will test octal, 4, 5, 6 and 7 pin tubes. It
will not test any miniature tubes. The unit works great. The front panel
and case are in excellent shape. It includes instructions and tube charts.
http://members.cox.net/radiostuff9/ge_tc12.jpg
http://members.cox.net/radiostuff9/ge_tc1.jpg
http://members.cox.net/radiostuff9/ge_tc13.jpg

Digital Precision 2440 Nixie Tube DVM.....$40 plus shipping
This unit will measure DC and AC voltage, and Resistance. This unit has
been tested and works. It does not include a power cord.
http://members.cox.net/radiostuff9/dp2440.jpg
http://members.cox.net/radiostuff9/dp24402.jpg

Accurate Instruments Model 158 Transistor Radio Tester.....$60 plus
shipping
This unit is a Transistor Tester, Signal Generator good up to 30 MHz
and Signal Tracer.
The transistor tester portion will test both leakage and gain of NPN and
PNP transistors reading quality on the meter.. The combination of these
three can be used singly or in combination for repairing or restoring
vintage transistor radios. This unit works and is in excellent
condition. It includes the test leads and the original manual.
http://members.cox.net/radiostuff9/xstr-radio_tester.JPG
http://members.cox.net/radiostuff9/xstr-radio_tester3.JPG

Batch of W.W.II Crystals.....$40 plus shipping
39 Crystals. See photo for frequencies. Here is a link to the frequency
conversion chart http://members.cox.net/n7rk/ft241_xtal_list.jpg
http://members.cox.net/radiostuff9/xtal_batch.jpg
http://members.cox.net/radiostuff9/xtal_batch2.jpg

Hewlett Packard HP 410C Voltmeter for Parts or Fix
It.....$20 plus shipping

Not working. It does not include a power cord or RF probe.
http://members.cox.net/radiodx3/hp410.jpg
http://members.cox.net/radiodx3/hp4102.jpg

Vintage Westinghouse Portable DC Voltmeter.....$35 plus
shipping
This meter in a heavy bakelite measures 0-150 volts and the ranges are
changed by making the appropriate connections to the meter. The ranges
are: 1, 5, 15 and 150 volts. This is a working unit in nice condition.
The instruction card on the inside cover has a date of 1942.
http://members.cox.net/radiostuff9/west_meter2.jpg

Bud - Neutralizing Transmitting Capacitor.....$25 plus shipping
I have two of these.
http://members.cox.net/radiostuff9/neutrcap.JPG
http://members.cox.net/radiostuff9/neutrcap2.JPG

485 pF Precision Variable Capacitor with Gear (Vernier)
Drive.....$20 plus shipping
Measures 15 pF min and 485 pf max. This capacitor is in excellent
condition. Nice capacitor for a receiver or a home-brew VFO project.
http://members.cox.net/radiostuff9/verniercap.JPG

Turner VT-73 Microphone.....$20 plus shipping
Neat Brushed aluminum housing. Manufacturer is unknown. Needs a new
cartridge which you can probably get from Radio Shack to work.
http://members.cox.net/radiostuff9/weirdmike.jpg

Unknown Microphone.....$25 plus shipping
Manufacturer is unknown. This does work and was hooked to a Ranger I
when I got it. I saw picture of this mike in one of K2TQNï¿½s columns in QST
http://members.cox.net/radiostuff9/odd_mike3.jpg

Philips 4-65A tube with Ceramic Socket.....$35
Build something! I did check the filament for continuity and it is OK.
No other way to test. The beige background makes the tube
appear burned which it is not!
http://members.cox.net/radiodx3/amp_465a.jpg
http://members.cox.net/radiodx3/amp_465asocket.jpg

Thanks for looking.

>source. Is this possible? I see all kinds of 12vdc inverters around but
>they all provide 120\240 vac
>....[snip]....

Can it be square-wave AC?

I once built a 12-volt to 120-volt inverter with two transistors, two
resistors, and a 120-to-12 volt transformer that was good for about
40 watts.

You might try using a transformer with two 12-volt windings, but, at
the very least, you could another 120-to-12 volt transformer "backward"
to give you 12volts AC. But it would be square-wave type AC.

I bought my 90651 new in 1955. It was
considered the best GDO *because* of
its good calibration. The accuracy was
very good for a time when frequency
counters were laboratory curiosities.

The CC-AWA Winter Swap Meet is just over a week away.
Saturday January 29, 2005 in Columbia SC.
You can find detailed driving directions, schedule
and a list of motels near by, here;
http://cc_awa.homestead.com/Winter.html

As with all CC-AWA Saturday Swap Meets, admission is
always FREE, dealer setup is just $5.

Folks usually start arriving at around 7AM, and
everyone is long gone by 12noon.
Don't waste your time by showing up at 10:30 or 11,
cause all you'll see is folks packing up.
Yeah it'll be cold, and that's real early, but do yourself
a favor, get out of the bed and come on over, this is a good
event that has been growing every year.
You NEVER know what you'll find...

See ya there,

73, Ron

>related both to CPU clocks and video synch signals.

Yep. 28.636 MHz is the 8th harmonic of 3.5795+ MHz, the NTSC color TV color
burst subcarrier frequency. Most early home computers (Apple II, Commodore 64,
Tandy Color Computer, Atari) used your TV as the monitor, and so the entire
computer was clocked at some multiple of the 3.58 freq.

Modern Nintendo, Sony, etc. game boxes probably follow the same rule, and since
every neighborhood has a few of these running, it's not surprising that you'd
get reports from all over the country, plus Canada, Latin America and I think
Japan, all using the NTSC system.

Since you want to make a big deal out of it, I have done such a thing on
certain topics in the past only to have them "recorrected" by those with
different facts and an agenda to promote.
You can do considerably better than this source for factual information.
It can't be assumed to be any more correct than a chat room.

Hi,

Does anyone know of a GR incremental inductance bridge,
or a Megohm bridge for sale or trade? I do electronics engineering,
but so far not much with radio, and have not gotten a HAM license...
maybe soon though. Two kinds of projects want some "old but good"
test equipment -- developing organic semiconductor printable
diodes wants a megohm bridge, and designing power supplies related
to that wants an inductance bridge.

Thanks for any suggestions where to look. I've seen these
GR bridges go by on ebay recently, but the prices were
steep, and some high prices were for damaged/partial equipment...

>I've seen these
>GR bridges go by on ebay recently, but the prices were
>steep, and some high prices were for damaged/partial equipment...

The prices are steep because both of these are still quite useful and there is demand for both. The 1633A, in particular, is a unique and very useful instrument, but mainly of interest to designers of audio- and power-supply-frequency transformers and inductors. I'm puzzled at why you would need one to develop a power supply, though. The 1633A is used to evaluate the characteristics of power supply transformers and chokes with "real world" AC and DC operating levels, although it does have some other uses. Were you planning to design and build your own power supply components?

These are like any instruments on eBay - if they are in good condition, and useful enough that there is significant demand for them, they won't be cheap. You wouldn't expect a useable rubidium frequency standard to close there for $2.00, would you?

The Euro is the currency of most European countries. They are required to use it instead of their former currencies.
To buy a Euro at your bank (or have Paypal convert it) will cost you about $1.40.

England is one country that did not adopt the Euro...they continued to use "Pounds Sterling", each one of which will cost you about $1.90.

To give you an idea of how far the American dollar has fallen, the Euro could be "bought" for 88 cents about three years ago, now it's close to $1.40

This matters because we pay for oil in Euros, so the reason you're paying so much at the pump is that the oil barons want to make the same amount of money (buying power) as before. This could be one reason we're in Iraq.

yeah, and it's like paying $1625 for an SPR4, $3250 for an SPR4 with a
synthesizer, $3900 for an R7, and $5200 for an R7 with a synthesizer.
(There's no consumer equivalent to an MSR-2).

You'd have to be strictly a rich collector to want to buy these!

Looks like one I restored several years ago, and traded off to a fellow in Indianapolis, except that the band change knob is not original. Probably, a few other folks have used those old "A" line signal strength meters. The original units used a round signal strength / audio level meter manufactured by Burlington and at least one other company.

Hi,

A friend gave me a JVC GZ-S3 camera and I want to use it for ATV.

This camera has a 10-pin connector to its power supply and VCR.
Unfortunately, I don't have any of the original units, so I cannot do
anything with the camera.

I want to homebrew a power supply or adapt one of the units I already have
and use the video signal for my ATV xmitter.

Does someone have some data about the GZ-S3 connector wiring?

This camera is a nice unit, with expensive optics, it was state-of-the art
back in the '80s. I hate the idea of ripping it away for parts.

Euros are far less confusing than dollars as there is only the one
type! With dollars you have to be careful as to which type is being
quoted - could be Hong Kong, Canadian, Australian or even sometimes US
or other types.

Worse are some Americans who quote a price on the
"inter-(national)-net" without even a dollar sign.

Incidently "Euros" are short for "Euro-dollars"

We've repaired & tuned an old S-38 receiver. It works well; however the knobs are the "after market" variety and takes something away from the radio appearance. An S-38 just ain't an S-38 without the original knobs; thus, we're looking for some originals.

The European community had officially decided that the word Euro has no plural. So the price of an item could be 1,000 Euro, but not 1,000 Euros.

Saying that "Euros" are short for "Euro-dollars is incorrect:
- Euros do not exist
- Euro is an independent currency not bound to the dollar (actually it varied from 0.84 to 1.37 of a dollar within a 3-year span)

I have never dealt with them but share you concern. I have restored an SX-9 and offer the following observations about their claims

" Okay the story behind this receiver, I purchased it for resale, Fedex delivered it but the sender didn't put any packing inside so the tubes got smashed. "

Little hard to believe since one of the claims to fame of the SX-9 was that it was the first to use all metal tubes.

I was surprised how good the receiver is and looking at the components, all except a couple of capacitors, everything else looks totally original. " Nothing original about that PS transformer, nor the spoke knob on the front. In addition There also seems to be quite a rats nest around the speaker.

It needs minimal work to return the receiver to its original glory, the cabinet is virtually unmarked and the face panel is very good, all original. There is a phone jack added to the upper right hand corner. Just to the left of the logo.

Mike -

I would actually start with the "S-Line" Reproduction items
http://www.advanced-optics.com/collins.htm

This will get you the weighted tuning knob, the pointer knobs, equipment
feet and wing emblem.

Why do you consider 97.2% a "terrible" feedback?

He has a reputation for grossly exagerating the condition of some of his items. Some say the photos he posts are not always the equipment he has for sale. Be careful.

73,
Darrell

"Why do you consider 97.2% a "terrible" feedback"

Because the odds of the buyer becoming one of the unhappy 3% is 10 times higher than if his rating was 99.7% and 100 times higher than if his rating was 99.97%.

I have only been cheated once on eBay, and it was by someone that had a lower feedback rating.

If you are giving money to someone, do you want them to be honest 97% or 100% of the time? Sure there is the occasional time when a buyer will not be happy, but I consider 3% significant.

You are right, but one cannot assume that all buyers are 100% reliable. Moreover sometimes negative feedbacks are just due to misunderstandings or incidents.

So, it would be more advisable to read the red feedback reports rather than just taking the percentage figure.

Aw RIGHT! Then you know what I am talking about! I found the restrictions at Dayton to be strange. Seems to me that would do more harm than good. To my mind, the crowding says 1) Ya got a good thing going, 2) If you find it necessary to "restrict" sales and inhibit the free exercise thereof, because of safety and fire regulations, then it is time to MOVE the thing somewhere else that CAN handle the crowd! I also find the idea that a hamfest would limit vendor passes, or not allow sales outside the allocated days because *some* people can't come kind of silly; why penalize those who have done their 30 years and have well-deserved time to come all the way to Dayton? Nobody's begging to come, right?

If I ever make the trip to Dayton, it will only be to look around..I say IF!! Many more restrictions like that, and wonder how many people will "just never get around to going to Dayton"?

Dale, when you come down to Shelby this fall, look us up! My buddy, K4EDK and I will be in the same spot we have had for 4 years! Jim LOVES all those old boat anchors and brings AM transmitters, parts, and stuff every year. He started hamming in 1955 and I rag on him all the time about my back hurting lugging that stuff around for him! LOL! Come down the hill at the Shriner's Pagoda (towards the lower gate that they usually close during the hamfest). Look for the first NON-paved lane going down towards the rear latrines (where the pavement circles in a "U" and comes up to the guy that sells the tents. Follow that unpaved lane from the Shriners to the first

PAVED cross-lane (blocked off for vendor spaces) We will be the FIRST spaces on the right--look for an older, black Silverado truck with a BIG 3" screwdriver. US old guys that aren't restricted by a desk usually show up NLT Tuesday prior the 'fest and start buying and selling soon after. By Wednesday, it looks like the "real" hamfest, and nobody gets upset!! The gates are wide open, and even the skinflints can come buy and trade without having to buy a ticket! (That may change because Shelby seems to be lasting longer and longer since there's as much stuff going on before Friday as Saturday) I wouldn't blame them for it.

Shelby is my favorite 'fest and the atmosphere is relaxed, there's plenty of room to expand. There's acres and acres that can be used for flea market area. It could prolly HANDLE Dayton's crowds. Heck, I have to have a golf cart to get around the thing as it is! LOL!

This guy is not honest. He lied about the condition of a receiver I bought
and when I challenged him, he left negative feedback for me. I'd avoid
dealing with him--he's a loser.

<snip>

Please don't post binaries to a text-only newsgroup. There are a
number of reasons for this, including (but not limited to):

(1) Many people, particularly outside the U.S., use a text-based
reader for Usenet that cannot handle binary images. Your encoded
information would have shown up as page after page of text gibberish to
them, which puts a real crimp in the possibility that someone overseas
might know an answer to your question.

(2) It wastes bandwidth. ISPs who carry the non-binary side of the
Usenet hierarchy expect them to stay that way.

(3) Perhaps most important: There are many folks, again outside
the U.S., who may not be able to get anything other than a dialup pay-
per-kilobyte-downloaded Internet hookup. By posting a binary to a non-
binary group, you are forcing them to download something that they may
not want to see, and that increases their connection cost.

The correct way to handle what you did here would have been to
post the picture of the device on a web site, then include a link in
your Usenet posting that points towards the picture.

Good luck identifying your unit.

It's not his newsgroup, but he's telling you the proper way to deal
with this. It has nothing to do with this newsgroup, it has everything
to do with every newsgroup.

Take note that here, your message didn't even arrive. It was a binary
post, and the newsserver didn't bother to grab it. Since binary messages
do take up a lot of space, this isn't going to be the only place that
deleted the message. Take note also that binary messages are not saved at
the google archive, so anyone who reads the newsgroup there will never see
your message.

If people don't see your message, then nobody will be able to help you.

If people don't see the binary, then there's no sense in sending it in
the first place.

YOu expected the photo to convey all the information, which some/many
will not see, yet you gave no detail in text that would take infinitely
less space than the photo. SOmeone might recognize the name, yet the
only way they'll find out is by looking at the photo.

And since were at it, what makes you think the unit is a boatanchor?
Does it use tubes?

364. FS: AUDEL'S RAIOMAN'S GUIDE 1952

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-24 02:21:34 UTC
From: Michael Crestohl <W1RC@verizon.net>
Message-ID: <uim8v01qu6qcrpdk9i4gmcm75lktikbi7g@4ax.com>
Source record: 19853
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors

I'm thinning out my library of vintage radio books and have decided this one has to go. AUDEL'S RADIOMAN'S GUIDE by E P Anderson, 1,040 pages, hardbound, 1952. Covers radio, television, industrial electronics and public adress systems. The book is in fair condition, the binding is a bit damaged aling the spine. However, all pages are intact and the above notwithstanding, is a good reader. $7.00 plus Media Mail postage.

If interested please reply by e-mail.

73,
Michael

Did the Heathkit SB-303 use tubes? Nuff said there. The speech compressor is housed in an aluminum cabinet painted gray, is about 5 in wide, 3 1/2 inches tall and 7 inches deep.It has a black face panel with four knobs at the top labeled left to right-Gain, Blanker, Level and Volume. At the bottom is a 4 pin male mic input on the left, a in/out, off/on switch in the bottom middle and a 1/4 inch phones jack on the bottom right.

There are no names on the unit, inside or out. No model numer, serial number or anything.

That is a basic description of what was in the picture. I posted to the group with a picture due to the fact there were no names or any info on or in the unit. I was not expecting to be jumped on like a piece of meat in a lions den. Never dreamed hams could be so nasty. And I do post pics in quite a few groups. If this one can't handle a pic for informational purposes, what good is it? I look at it this way, if you don't like what I do, stay in your own yard and don't look over the hedge row and I will do the same. Thats the problem with the world today, everybody want to run something and no one agrees on how to run it. Just ask Bill and Hillary Clinton.

And no, it does not use tubes, but one of the chips inside has a date of 1970, so it was built at the same time as many boat anchors. And yes google does archive binary posts. Just looked at one a few minutes ago.

waste bandwidth?

all the below b/s and nobody has helped the guy out yet. ever heard of
a helpful, friendly email? oh, i forgot, that won't publicly embarrass
the guy.

and friend, to attempt to answer your question, i would start by taking
off the covers and looking inside. from the picture, i can't identify
the unit, maybe the inside will give you some clues. markings on parts,
etc. also, possibly matching the circuit to something out of a handbook.
just a thought.

i would not rule out a VERY nice homebrew unit. granted, the nice front
panel may be a stretch. but if the looks place in the 1960'/70's range,
there were some very talented amateurs doing homebrew back then. it is
also true that many small outfits were making modulators and speech
processors.

i know it's nothing definite, but maybe a place to start. all the best
and good luck.

I should also point out that many ISPs, including mine, don't forward news containing binaries unless they're to a binary newsgroup. As my ISP provides a news feed to a quite a few other news servers it meant your message didn't even reach us.

Just about every radio from "him", is his personal unit, retubed
and tuned to factory spec's, or the best one he's ever seen.

Pretty much the same set of superlatives each time.

Perfect sense sir. Neither use tubes, but are considered boat anchors. If the use of tubes were the only determining factor as to if it was a boat anchor, then all currently mfgd. amplifiers are boat anchors. This does not make sense.

Try putting a chute on the next time you jump and you will not land as hard.

First off there radiofart does not indicate the "extra" phone jack near the
Hali logo.
There are probably other mods as well.

However, he does 'fess up to the fact that he received this radio in damaged
condition and retubed it.
Translation : this radio is mechanically screwed up.

I see a bent front panel, transformer askew (probably not original) one of
the IF cans has a good dent on the top.

Nice vernier too (?!?)

373. What does a bad power supply filter sound like?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-24 13:47:27 UTC
From: John Williams <ac6ts@n2.net>
Message-ID: <1106574247.460460@smirk>
Source record: 19862

Group,

I need an expert opinion on a Swan power supply.
I have a 350c and 117xc. The transceiver has problems I will deal with later. For now, without any test gear, I want to rule out power supply because I'm putting it on ebay. The rig I'll have to sell seperately to a swan tech. on a reflector like this.

The radio has a consistant loud "CRACKLE" noise on receive. (there is No 60 cycle hum.) All bands, all volume levels, all rf gain levels, with/without antenna. crackle noise is steady. Without need to warm up.

This is my 4th swan and I always thought a bad filter cap would hum, not crackle. And I've had shorted caps blow fuses.

On transmit I get full power out without noise on seperate monitor.(when it decides to oscillate). Quiet carrier on CW an clean modulation on ssb.

The rf detector works, because I can hear stations through the crackle when it decides to ocillate.

The rig also has an intermittant oscillator problem. RX and tx blink on and off as I turn vfo dial or turn rf gain knob or key relay over and over. There are no vfo "hot spots' where the oscillator quits or starts. It is random and changes spots in dial travel on each try. Same thing on rf gain. I'm not going to try to fix the rig, but is worth restoring to a collecter due to near museum cosmetics. All that later.

I just want to know if power supply is probably ok.

No other rigs to put supply on and no scope to look at wave forms.

I need an educated oppinion for now. Does a bad power supply CRACKLE?

Thanks for reading.

I believe your power supply is OK. sounds like an output transformer or output tube to me. Unplug the output tube and see if it stops the noise.If it doesn`t stop the noise ,it would be transformer shorting..If the volume control changes the noise then it could be a shorted IF can..NO 1 RULE, make sure all tubes are good first...good luck W4PQW

>> I always thought a bad filter cap would hum,

Correct. A bad filter capacitor typically creates a loud hum that does not change when you move the volume control.

Phil Nelson

379. Re: What does a bad power supply filter sound like?

Newsgroup: rec.radio.amateur.boatanchors

Source record: 19868

Yes, a bad capacitor can cause this problem. So can a lot of other
things.

A capacitor which is arcing internally (dielectric breaking down) sounds
just like you described. Chances are it'll be a bypass or coupling cap.
Other things to try are; wiggling tubes (corroded sockets), look for
cracked resistors, cold solder joints.

Good luck!

Steve
p.s.-a bad filter cap usually causes hum which you'd hear in the speaker,
and possibly on your transmit audio....filter caps can also arc internally,
but
in my experience, thats not as common

Just sell the darned thing "as-is". I've sold many Swans on ebay.....it doesn't make much difference if it is a "tech special" and needs work or is of average, working condition. They get about the same price. Just be honest on the description......if it is complete and needs a little work, there are many guys looking to pay good money if it is clean and just needs some simple bench work to get it going right.

If it doesn't need to be warmed up to hear the crackle, does it have solid state rectifiers? Will the noise come thru with the volume turned all the way down?

For what it's worth, all of the HV caps in my Swan 350/117 needed
replacing. They big ones for the transmitter were oozing gorp.

Yours caps are probably from the same era, and should be replaced too.

Henry Kolesnik wrote:

The 117 powersupply is solidstate, and so the crackling is very likely
the filter caps preparing to go blorp all over the place.

If you go back far enough in this guy's feedback, you'll see that someone accused him of bidding on his own auctions under the name "gottahaveit1998" or something like that. Both accounts were then suspended; I think the gottahaveit account is still gone. He came back some time this fall - I had to chuckle when I saw his first auction and it said "well, I'm back after an extended summer vacation". Yup, sure.

I do *not* know if he was bidding on his own auctions for sure. But he and the gottahaveit guy sure traded a lot of feedback, and they both lived in Ky, and they both had the first name martin...

don't know if it's the same guy but I've bid against a
gottahaveit....,

Given my pattern of setting my own max price, I lost to him each
time. It's entertaining to consider that he had to pay eBay their
commission when he "beat" me. He does save on shipping, I suppose.

If a radio looks good, I make my best estimate and bid my max. I'm
a sniper and shill's nightmare. I also pay as fast as I can and
leave accurate feedback, so I'm a fair seller's dream. No games.

(I'm enjoying that very nice 75S-1.)

However, if you had bid, say $800 max for that mint SX-115 and nobody else bid it past $500, the shill bidder (your "gottahaveit1998" friend) will drive up the price for you. A radio you could have gotten for $500 now might cost you $700 because of the shill bidder.

Anyone who deals like this is dishonest and should be *permanantly* banned from eBay. Again, I do *not* know that gottahaveit1998 was shilling for radiomart.

Source record: 19880

Radio-mart knowingly overstates the condition of a lot of his equipment listings and when he is called on it and is
given negative feedback he automatically retaliates by giving a negative to the unsuspecting buyer. He uses
gottahaveit1995 as his buying arm on EBAY. If you check his recent listings you will see a 302C-3 wattmeter
(5745961498) and if you look carefully you will see an extra screw on the front panel. This was clearly stated in the auction that
he bought it off (5742819744) and as you can see from his listing he conveniently has failed to mention this which lowers the
units worth. Someone new to Collins may not pick up on this. Notice he says he can provide better pictures on request
yet the original listing has better pictures of the unit that clearly shows the added screw and some distortion of the area above it from its addition.

He probably keeps the bidding on his auctions private to keep others from seeing how he buys and resells items on EBAY and also prevents
those who are about to do business with him or have done so from communicating about specific items he has listed or sold.

If the end tabs of the C-ring each have a hole, then the official tool is
pretty simple. I have a couple of those tools. Unforch, they are "Hong Kong
Hardware" quality tools, and so it's a one-handed job, but very hard on the
throat from the constant profanity needed to "cheer the team" to success.

Maybe you are talking about a larger version of the simple rings, with no tabs,
that hold pot shafts into a pot, for example. Those would require two pliers.

I've written about my strategy and it covers more cases than that.

Part of it is knowing the product, the market, my desires, and knowing what I will pay from the beginning. As I own an SX-101A and a 75S-1, I'm not especially interested in an SX-115, mint or otherwise. Why is an SX-115 $5,000 (or more) and a 75S-1 is $250-300?

Using your example, I would "know" that the right price is $500

($500 is not the right price for an SX-115 but lets go with your numbers and your example.)

If I really, really wanted that one, I would bid $687.

Scenario 1 - The shill comes along, jacks up the price 630, 650, 670, 690, figuring that like most people, I've got a proxy at 700, and even number or 701, just over an even number. But no. I'm sitting on 687 and -bing- he's got it.

Scenario 1a - The shill is waiting for me to have second thoughs, "I'm not letting this one get away. I want it." hours pass, days, the auction closes, too bad shill. I set my price. You can pay eBay's commission.

Scenario 2 - We try again. This time the shill thinks he knows my limit. Well, if I see a similar radio coming around a 2nd time, I figure that there is a 3rd and a 4th. I got time. I got money. I can wait. This time, I don't bid $687, this time I proxy bid $538. Same thing happens, he edges up on me and -bing- he's got it again and is paying a 2nd commision to eBay.

Scenario 3 - The shill opens. He sits on a $1.00 opening. I'm still interested in the radio. I bid a fair price but lower

than before because I now believe that there are dozens of these radios. I don't know I've been bidding on the same one but each time it shows up, I drop my estimate of the price. Now I open with $467. The bid goes up to $2.00

What does the shill do? How far can he ease the price up before he's paying a 3rd commission to eBay?

I don't expect to "steal" a radio. I expect to pay a fair price. If I get it for a little less, that's great. If I really want the radio, I'll pay a little more than "market". How much more? That's the question. Each time the shill guesses wrong, he pays a commission to eBay.

He can't run the price up too high on me. Although I'm bidding $467 when everyone else is bidding $3, $9, $15.25. When they're caught up in a bidding war and going $550, $580, I've dropped out at $467.

Finally, I like the nym "gottahaveit". It scares me off. I suppose he chose it thinking that it would stimulate competition but I respond differently. If you gotta-have-it, well, you can have it.

There're no guarentees.

WHO is Radio Mart?
WHERE does he live?
HOW will we recognize him at a hamfest?

Is he one of these guys like Thomas J. Bruckner who would go around to ham fests buying tubes from hams for pennies on the dollar and then put them up on his site http://www.elexs.com/ for 100's or a 1000 times more than what he payed.

That little F****r always pissed me off with his fox like approach to picking apart some guy to buy his tubes. He would stuff his bag go back to the car and hunt for more. He used to hit EVERY ham fest in the northeast and midwest. It was funny as hell when he missed a deal. He would sputter and sweat and try to talk the guy out of his purchase. He would have is wife spotting the suckers and then he would go in for the kill.

I hope not - even as a curiosity - I'd think $15 would be a premium for that. Last one I bought (admittedly 30 years ago) was for $1.40 (twenty cents a pound from the Defense Department scrap yard on Guam). Couldn't find a 1H5 real quick - so I stuffed a transistor in place of it - ran off of 9V just fine. Still never found anything practical to do with it - finally just tossed it when we moved back to CONUS.

best regards...

Trent - your response to the first post, which was written in a polite and helpful tone, nor your responses to subsequent posts, does not motivate one to go out of the way to help you.

Nevertheless, as it appears that it's probably a homebrew unit, I recommend you open the cover and see what chip(s) it uses, then do some research to reverse-engineer it. I have several pieces of homebrew equipment that you'd swear were factory made - but in the case of a synthesized VFO, the fact that it was the subject of a QST article back in the 1960s was the only thing that gave it away as a homebrew unit of extraordinary quality.

Signetics made some compressor/compandor chips back in the 1970s and 1980s - IIRC the NE571 is one such IC.

Good luck and 73, John W3JN

gottahaveit1995 bought this radio from me on ebay several months ago.
The serial numbers match up. His description about the previous owner
owning it for 8 years is rather untrue along with a lot of other BS. The
radio did work well however. He actually bought a whole bunch of
SX-100's that week from a bunch of different people, not one person who
had 6 of these.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4673&item=5746492404&rd=1

The radio's case had been poorly repainted. He paid over $300 for it so
will be interesting to see whether he breaks even or not!

Hmmmmm!

Hello all,

I have a nice RAL-8 receiver that needs e few parts.

-both meters
-one inner meter cover.
-cover for the main tuning condenser
-4 tube shields
-audio tuning on off switch, I have simmilar switches, but none look right.
-small name plates for "audio tuning" and "on off" below the audio
tuning also the "freq. vernier" plate.
My name plates are of a thick plastic? material.

Anybody has some of these available???
Are there any things to this receiver to watch out for?
Any help much appreciated.

thank you,
Pieter

And he says 'due to two total time wasters I am relisting' - read it
this way - "I'm a BIG TIME shill bidder. That's why I hide the
bidder IDs - that way you can't see Gottahavit1995 bidding the
price up. Sometimes I mess up and win my own item. Rats! - it
happened TWICE to me this time around'

What a skank

Well of course - you can't get accused of SHILL bidding if the
others cannot see the bidder IDs. Gottahaveit1995 undoubtedly
shills up everything - once in a while he 'wins' his own auction,
then comes up with some lame excuse why the item had to be
relisted. What a squid!

He's bidding on his own items as he was in late 2003 and early 2004 before ebay threw radio-mart and gottahaveit1995 off.

He is best at scamming the Collins Collectors....they deserve whatever they get from Martyn/Leslie.

Meanwhile....ebay continues to make $$$ from all the sales of equipment. So, not only does ebay make money once (when Martyn buys as ID gottahaveit1995)...they make it TWICE when radiomart sells the very same item some two to three weeks later. Ebay can't beat that, now can they! Is it any wonder why they allow him to continue to scam the public?

I'll bet he does! It looks good in the pics and his desc helps. I
guess that it goes to show you that it's all in the listing. >>

Another thing wrong with the listing is that he states it is in excellent
condition. Even when new, the SX100 was so mechanically unstable you couldn't
use a key on the same table with the receiver. SSB was difficult. No such
thing as an excellent SX100.

Don

> 73 John W3JN

I've written about my strategy and it covers more cases than that.

Part of it is knowing the product, the market, my desires, and knowing what I will pay from the beginning. As I own an SX-101A and a 75S-1, I'm not especially interested in an SX-115, mint or otherwise. Why is an SX-115 $5,000 (or more) and a 75S-1 is $250-300?

Using your example, I would "know" that the right price is $500

($500 is not the right price for an SX-115 but lets go with your numbers and your example.)

If I really, really wanted that one, I would bid $687.

Scenario 1 - The shill comes along, jacks up the price 630, 650, 670, 690, figuring that like most people, I've got a proxy at 700, and even number or 701, just over an even number. But no. I'm sitting on 687 and -bing- he's got it.

Scenario 1a - The shill is waiting for me to have second thoughs, "I'm not letting this one get away. I want it." hours pass, days, the auction closes, too bad shill. I set my price. You can pay eBay's commission.

Scenario 2 - We try again. This time the shill thinks he knows my limit. Well, if I see a similar radio coming around a 2nd time, I figure that there is a 3rd and a 4th. I got time. I got money. I can wait. This time, I don't bid $687, this time I proxy bid $538. Same thing happens, he edges up on me and -bing- he's got it again and is paying a 2nd commision to eBay.

Scenario 3 - The shill opens. He sits on a $1.00 opening. I'm still interested in the radio. I bid a fair price but lower

than before because I now believe that there are dozens of these radios. I don't know I've been bidding on the same one but each time it shows up, I drop my estimate of the price. Now I open with $467. The bid goes up to $2.00

What does the shill do? How far can he ease the price up before he's paying a 3rd commission to eBay?

I don't expect to "steal" a radio. I expect to pay a fair price. If I get it for a little less, that's great. If I really want the radio, I'll pay a little more than "market". How much more? That's the question. Each time the shill guesses wrong, he pays a commission to eBay.

He can't run the price up too high on me. Although I'm bidding $467 when everyone else is bidding $3, $9, $15.25. When they're caught up in a bidding war and going $550, $580, I've dropped out at $467.

Finally, I like the nym "gottahaveit". It scares me off. I suppose he chose it thinking that it would stimulate competition but I respond differently. If you gotta-have-it, well, you can have it.

There're no guarentees.

Message-ID: <cGBJd.9888$rp1.6128@newsread3.news.atl.earthlink.net>
Source record: 19803

My problem with the whole mess was this: I had no idea this was an all text, no binary format news group. No where was this written or explained. Another fact is: there are other pics listed in this group, but no nasty messages posted to them.

As it appeared to me at the time, I had invaded a good old boys plot of turf and was being told I was not welcome. I have been a user of the Usenet system for years and have never been treated as I have been on this net. Does not say much for the users of this group. I left chicken band in the early 90's to escape the rude ill mannered people that were there and became a ham due to what I heard on the bands. People talked with each other and did not use foul language and call names and were polite. That is why I came to the group to try and get some information on a piece of equipment. The first response was a "YOU DID A NO-NO". What was written you may call polite, but I beg to differ. The Usenet is just that, a Usenet. It is for all of us to use and not for a select few to control.

On another note, I did open it up and it uses Motorola chips which I can not cross. The dates on the chips are 1970 and it appears to operate off 15 volts using two 7 1/2 volt batteries. I did get it to operating and it seems to work well on my Drake TR-4 and my SB-401. Got good reports and much better PEP with little clipping.

Thanks for the help and I am sorry for blowing off some steam, but I am the type of person, that when jumped at with no explanation, will jump back. If I do something wrong, tell me what I did wrong and ask me not to do it again. Go the other way and I can get very hard headed. I don't take kindly to being TOLD what I will do.

You mean to say YOU never had a good one. I use one nightly (Mark
I version no less), with the .5 kC filter setting and pound brass into the
night. Solid as a rock. Same on SSB. Never had an ounce of 'instability'
with it. You must have had a crappy one or three...

***You great pillock,just what do you think the following cut and paste of the first reply to your post to is?
He couldn't have been more instructive or polite,he even wrote"please".

Bruce Lane wrote:-
"Please don't post binaries to a text-only newsgroup. There are a number of reasons for this, including (but not limited to):

(1) Many people, particularly outside the U.S., use a text-based reader for Usenet that cannot handle binary images. Your encoded information would have shown up as page after page of text gibberish to them, which puts a real crimp in the possibility that someone overseas might know an answer to your question.

(2) It wastes bandwidth. ISPs who carry the non-binary side of the Usenet hierarchy expect them to stay that way.

(3) Perhaps most important: There are many folks, again outside the U.S., who may not be able to get anything other than a dialup pay-per-kilobyte-downloaded Internet hookup. By posting a binary to a non-binary group, you are forcing them to download something that they may not want to see, and that increases their connection cost.

The correct way to handle what you did here would have been to post the picture of the device on a web site, then include a link in your Usenet posting that points towards the picture."

Your arrogance is astounding!!

"VT1" <vt_i77b@yahoo.com> wrote

WHO is Radio Mart?
WHERE does he live?
HOW will we recognize him at a hamfest?

Is he one of these guys like Thomas J. Bruckner who would go around to ham fests buying tubes from hams for pennies on the dollar and then put them up on his site http://www.elexs.com/ for 100's or a 1000 times more than what he payed.

That little F****r always pissed me off with his fox like approach to picking apart some guy to buy his tubes. He would stuff his bag go back to the car and hunt for more. He used to hit EVERY ham fest in the northeast and midwest. It was funny as hell when he missed a deal. He would sputter and sweat and try to talk the guy out of his purchase. He would have is wife spotting the suckers and then he would go in for the kill.

***** He pissed you off because HE got off his arse ,stuffed his bag with tubes (legitimately, under a capitalist system that we all hold so dear),and sold
them on his website,made a profit and you didn't!!

Dear oh dear!!!

What an indication of the human condition!

Brian Goldsmith

I imagine it is poor business economics to sell an item back into the
very same market that you have just bought it in unless you have added
value to it by improvement or a more accurate description which shows
it to be a more valuable item than the original vendor recognised.

Mind you I think mis-representation or use of hidden bidders without
good reason is unethical - I would never bid where the latter applies,
but it can be hard to recognise the former.

Doug

It looks as if you have a ham call but I assume it is a fake email
address as I don't expect this sort of language from a licenced ham -
at least in VK, where this sort of language is confined to CB, but
maybe the US is different.

Unless you add some shill bidding to the mix to drive up the price.

It's explained in news.announce.newusers. NONE of the big eight groups allow
any binaries. This is just so fundamental that anyone who has been through
the introductory material in news.announce.newusers has been told a dozen
times about this. Posting binaries to discussion groups is about the most
rude possible thing you can do on Usenet.

>As it appeared to me at the time, I had invaded a good old boys plot of turf

This "net" is just part of the big eight. If you did something equivalently
boneheaded to any of the other big eight groups you would have got a similar
response.

I'd mail this to you, but you seem to have some sort of goofy challenge/response
mail system.

Quite a while ago he got an item from me via eBay. Several weeks later it appeared, with MY pictures, on eBay and he said it had belonged to his father and he spoke about it in glowing terms and with what was obviously to me incorrect information.

I e-mailed him and asked him what was going on. He responded with some nonsense about he was just making the auction more interesting.

He's well known on many of the radio mailing lists and will use one account to buy and another to sell. Reportedly he'd had his account(s?) closed by eBay but seems to keep popping back up. Others have reported that they have seen items that he's purchased from others auctioned by him with pictures that are fuzzy or not to show defects and blemishes.

Deal with him at your own risk!

By the way, he is not a licensed ham. Ask him what his call is and he will give you some baloney story about looking for him on 15 meters. Would not give his call. A name search search on QRZ shows nothing. His first name has an unusual spelling so it would be easy to find if he were licensed.

I sent him an e-mail on the SX-100 and asked him what was up with his description and he e-mailed me back to check the listing in a few minutes. I did - he ended it with "Their was an error in the listing"

Or a red backdrop. The folds in that red cloth add the value.

Anyone know if that's what happened last year when an SX-100 went
for $1,000+ ?

Doesn't matter as they fall into three categories.

1. Bottom feeders who aren't will to pay a fair price. They fall
out of the bidding early.

2. Feedback(0) who are willing to pay too much. They win the item
of course but I'll get the one next week or the week after.

3. Serious buyers who are watching their pennies as closely as I am.

Seems odd to call "shenninagians" what's actually simply deciding
what an item is worth to me and offering up a fair bid.

That term, however it's spelled, is better applied to "shilling" or
"sniping".

I have bought primo Collins gear from r.r.a.b members using my
method. Decide what I'm willing to pay, offering up my bid.

All I ask is that their photo's and descriptions are honest and they
pack the item well.

Don't forget guys - AOL is just a net pipline like
anyone else. You don't need to use ANY of their
crap! Log on, minimize their 'toy' browser window,
and launch whatever net application you want. There
are numerous free Newsgroup servers out there,
and many free news readers. I use a free service, so
I know this to be true. Better still, ditch AOL and
get DSL/Cable or at least a cheaper dialup. How
do they get away with what they charge these days???

Dale, you might be interested that there will
be two groups of GenRad papers on the block
at the Charlotte Conference. One has I think 2
GenRad catalogs and some other papers, and
the other has several GenRad "Experimitters"
I think was the name on them.
All in nearly mint condition.

No, AOL is not a net pipeline at all. AOL was actually a messaging service that was independant of the net, and with the huge publicity about the internet in the early nineties, they gatewayed themselves (very badly) to Usenet and then to the web services. AOL in fact does not provide complete connectivity at all, but only a very simplified set of ports are available and many of those are proxied in some way.

AOL is not really intended as a regular ISP, although over the years they have done more and more thing to it to make it function as one.

My guess is that not enough people use Usenet and it costs them money to run, so they are eliminating the gateway. Perhaps they should never have installed it in the first place.

Shilling is STEALING. It's taking money right out of your pocket for the sole benefit of the seller. It's also illegal in most states and auctioneers can lose their licenses over this.

You may be happy paying more for something than you have to but I prefer not to deal with someone who is demonstrably dishonest. Who knows how *else* they might screw you?

I have heard so much bad about this guy so I just had to go and check out his auctions and feedback. I will truthfully have to say I don't find him as bad as I was led to believe by the posts I have read about him. Yes I expect he is not 100 % honest but then how many of you can truthfully say you are ? I see an awful lot of his customers are very satisfied. I also see a few buyers that I would not want to do business with. With the business that this guy does he has to end up with a few bad customers that will never be happy no matter what you do to make them happy. Yes like all deals be careful. I would buy from this guy before I would buyer from a lot of other Ham's I know. A person needs to be careful with everyone they are dealing with these days it seems.

Yes I expect he does some stuff that should get him kicked off eBay. With the business that he why he think he needs to play games I will never understand.

Just my two cents worth,
Ron WA0KDS

If the volume control varied it, I would have suggested bad
caps in the IF transformers. See my page
http://www.geocities.com/wa2ise/radios/repair.htm
about half way down.

I'm not familar with this radio, it's a tube set, yes?
If so, try pulling the audio output tube. Still crackle?
Put the tube back and pull the audio driver (probably a
triode like a 6AV6). If you can get silence doing this,
then the problem exists somewhere closer to the front end.

What are you referring to?????

I'm a shill's nightmare. Many auctions that I've been in have
run-away, way above my max. Strangely, the prices of similar items
eventually settle down to more reasonable levels.

I can wait.

I'm here suggesting to folk that they set their max and stick to it.
One of the shill's tricks is to run up the price and hope that you
say, "ah, I can still get it."

Well no. If it's a dollar above my limit, it's above my limit. In
the near future, I'll probably have a chance to get one for even
less.

Shill, you can have it. I'll wait and get a better one for even
less.

Ron -

Thanks for the heads-up. I'll look for those at the auction. Yes, it is "General Radio Experimenter" - their monthly newsletter published monthly from mid-1926 to mid-1972 to promote newly introduced instruments and to demonstrate applications for their instruments. I have a solid block of several years from the 1930s, but spotty coverage of the rest of the years. Even if the Experimenters and catalogs are dupes of what I have they are still worth bidding on for trading with other collectors.

As a collector of old radios and old instruments, Charlotte is one of the two events that I try to attend every year, the other being Shelby. Unfortunately I had to miss both in 2004, but should be able to make both this year.

Here are a some items for sale. Prices do not include shipping. I will ship overseas.

Hewlett Packard HP 331A Distortion Analyzer.....$100 plus shipping
Clean working unit. No power cord.
http://members.cox.net/radiostuff9/hp331a.JPG
http://members.cox.net/radiostuff9/hp331a2.JPG
http://members.cox.net/radiostuff9/hp331a3.JPG

General Electric TC-1 1930's Tube Tester.....$60 plus shipping
Neat art deco looking unit from late 1930's. It tests tubes from the 1920's to beyond the 1930's as it has some updated tube charts. It will test 6L6's, 6V6's, etc. It will test octal, 4, 5, 6 and 7 pin tubes. It will not test any miniature tubes. The unit works great. The front panel and case are in excellent shape. It includes instructions and tube charts.
http://members.cox.net/radiostuff9/ge_tc12.jpg
http://members.cox.net/radiostuff9/ge_tc1.jpg
http://members.cox.net/radiostuff9/ge_tc13.jpg

Digital Precision 2440 Nixie Tube DVM.....$40 plus shipping
This unit will measure DC and AC voltage, and Resistance. This unit has been tested and works. It does not include a power cord.
http://members.cox.net/radiostuff9/dp2440.jpg
http://members.cox.net/radiostuff9/dp24402.jpg

Accurate Instruments Model 158 Transistor Radio Tester.....$50 plus shipping This unit is a Transistor Tester, Signal Generator good up to 30 MHz and Signal Tracer. The transistor tester portion will test both leakage and gain of NPN and PNP transistors reading quality on the meter. The combination of these three can be used singly or in combination for repairing or restoring vintage transistor radios. This unit works and is in excellent condition. It includes the test leads and the original manual.
http://members.cox.net/radiostuff9/xstr-radio_tester.JPG
http://members.cox.net/radiostuff9/xstr-radio_tester3.JPG

Batch of W.W.II Crystals.....$40 plus shipping
39 Crystals. See photo for frequencies. Here is a link to the frequency conversion chart http://members.cox.net/n7rk/ft241_xtal_list.jpg
http://members.cox.net/radiostuff9/xtal_batch.jpg
http://members.cox.net/radiostuff9/xtal_batch2.jpg

Vintage Westinghouse Portable DC Voltmeter.....$35 plus shipping
This meter in a heavy bakelite measures 0-150 volts and the ranges are changed by making the appropriate connections to the meter. The ranges

are: 1, 5, 15 and 150 volts. This is a working unit in nice condition.
The instruction card on the inside cover has a date of 1942.
http://members.cox.net/radiostuff9/west_meter2.jpg

Bud - Neutralizing Transmitting Capacitor.....$25 plus shipping
I have two of these.
http://members.cox.net/radiostuff9/neutrcap.JPG
http://members.cox.net/radiostuff9/neutrcap2.JPG

485 pF Precision Variable Capacitor with Gear Drive.....$20 plus shipping
Measures 15 pF min and 485 pf max. This capacitor is in excellent
condition. Nice capacitor for a receiver or a home-brew VFO project.
http://members.cox.net/radiostuff9/verniercap.JPG

Unknown Microphone #1.....$20 plus shipping
Neat Brushed aluminum housing. Manufacturer is unknown. Needs a new
cartridge which you can probably get from Radio Shack to work.
http://members.cox.net/radiostuff9/weirdmike.jpg

Philips 4-65A tube with Ceramic Socket.....$35 plus shipping
Build something! I did check the filament for continuity and it is OK.
No other way to test. The beige background makes the tube
appear burned which it is not!
http://members.cox.net/radiodx3/amp_465a.jpg
http://members.cox.net/radiodx3/amp_465asocket.jpg

Thanks for looking.

458. Re: why is AOL eliminating newsgroups

Newsgroup: rec.radio.amateur.boatanchors

Source record: 19747

I have been in contact with AOL about the dropping of the newsgroups and their official response is basically "not enough participation" but my guess is that they are cheapening out. Everyone who reads this list on AOL needs to write them about keeping it. I told them that this was the last straw and I may go to a DSL which is actually cheaper. And they complain about losing members.... makes you wonder which non customer oriented MBA thought this one up. By the way, you can get the newsgroups free by going to http://groups.google.com and signing up.---Mike

459. Help with SP-600 alignment

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-28 03:06:09 UTC
From: Jim Mandaville <zygo@azstarnet.com>
Message-ID: <zygo-E09372.20060827012005@corp.supernews.com>
Source record: 19748

I'm trying to touch up the oscillator on one band of my SP-600-JX6 (it's about 20 kc off on the dial) and am having trouble getting any action out of the C or L trimmers. Looking down through the first two uncapped holes in the top of the front-end section: Looking straight down I see nothing adjustable by screwdriver. Looking at a bit of inward angle I see a possible adjustment point but it's a rather deep with a small screw head and very difficult to "find" with my screwdrive tip (even using quite fine tips). Am I after the right thing? Do these trimmers had a tendency to freeze up or "lose" their slots? If so, can they be reached by opening the compartment from below so they can be freed up?

I do have a service manual, but it's speechless on such little mechanical problems.

Also, can anyone advise a source of SP-600 parts? I need a replacement S-3, the rotary switch that links the crystal oscillator section to the main front-end section.

Any help/advice much appreciated.

Jim, KF7A

460. white powder on Drake AC-4 chassis

Losing money? Too expensive? I work for an aggregator and we re-sell
Supernews tp ISPs (we give it away to our retail customers.) We get $50 a
month from an ISP for news, no matter how many users they have.

I remember seeing ads for this unit in old QST magazines (you know, the
little ones...). I believe it was made by a small obscure company as a
speech processsor for the Collins KWM-2 radio gear. Maybe early Autek stuff?

Trent,
I looked it up and I think it's a DX Engineering speech processor. They made 2 units, one for Collins 32-Sx transmitters, and one for the KWM-2 transceivers. Here are the model numbers:

LC-1-32S (for transmiiters)
RF LC-2-TR (for transceivers)

I believe the "RF" model is a true RF speech processor, while the other one is just an audio compressor.
Hope this helps....

Mark, it's not a DX Engineering rf speech processor for Collins.
Those units were installed internal to the Collins equipment.
(You removed an i.f. amplifier tube, plugged the DX Engineering
device into the empty tube socket, and then plugged
the i.f. amplifier tube into the new socket on the DX Engineering device).

Trent's mystery device looks similar to a Comdel CSP-11
speech processor, but only because it uses the same cabinet
made by LMB.

The type of mic jack looks like that on a Drake TR-7.
I would guess this was a nice home-brew equivalent
of the Drake SP-75 speech processor,
with a headphone jack and volume control added for adjustment by ear.

I would use a mild acid, like lemon juice, or tomato juice. They both make copper shine right up. You must be sure to do a good rinse afterwards.

I cannot say for sure what would happen to the lettering, but as long as you don't scrub, it should be ok.

Old steel chassis boxes are frequently zinc or cadmium plated. When the plating gets damp, it oxidizes. If it is zinc plated, you get a white powder that is zinc oxide. If it is cadmium plated you get a yellow powder which is cadmium oxide.

If you scrub, you will make a chassis that looks scrubbed. What I sometimes do is blast the majority of the dust off with compressed air, and a gentle dusting with a paint brush..

Cut small piesces of tape and cover the writing .
Be very careful of what you use, cleaning the copper is hard because
it's plating and could be removed easily.

481. Kurrajong Military Radio Museum - building and website update

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-29 11:58:05 UTC
From: Simon <vk2ua@HATESPAMyahoo.com>
Message-ID: <o9umv0h3h29tkg1he0232b5muka2d55opo@4ax.com>
Source record: 19771

Those interested in military radio collecting might like to look at the web site for the Kurrajong Military Radio Museum. The physical construction of the museum has been under way for the past 2 years following a move to a new site with opening expected later this year.

In the meantime a web site has been set up giving details of mainly Australian, British and US equipment plus a few items from other countries. So far about 80 pieces of radio equipment have been listed with photos, history, technical details and in many cases circuits/schematics.

Many of these items have not previously been described on web sites and new pieces of equipment are being added on a regular basis, recent additions being the R-274/SP600, BC-1000, WS-38, RAN Tuner C, RJB-4 and the URM-32.

The museum owner, Ian, VK2ZIO, is always happy to exchange information with other collectors. His contact details are included on the web site at

http://www.vk2bv.org/museum/index.htm

Brasso works well, also, but requires some buffing.

I have been tinkering with a Heath SB 610 Monitor Scope with the apparently fairly common problem of a Blown Power Transformer. I read somewhere of people using an "outboard" transformer to work around this problem. So, which winding is it that blows: the 215 VAC or the 600 VAC. And can one just disconnect the blown winding and connect the additional transformer at the appropriate point? Thanks for any info.

Jim:

The adjustments are in there! It's been 6 years or so since I worked on an SP-600, but I remember that those adjustments were hard to locate. If you have an otoscope (the thing the doctor uses to look in your ears) you can spot the adjustments with ease. Taking off the bottom cover may provide a bit more light. I don't recall having any problems with stuck or frozen adjustments. Persistance will pay off!
Best Regards,

Ed

Been cleaning out the shack. Here are a bunch of ham radio books,
catalogs, etc. Prices do not include shipping. I will ship overseas.
Thanks for looking and happy new year

Dave N7RK

Description Price Condition
Radio Handbook (Bill Orr) 1956 $25 Excellent - call of previous
owner on inside covers

Radio Buyer's Sourcebook-1991 ARRL Book $6 Excellent

Practical Wire Antennas-RSGB Book $15 Excellent

Handbook of Semiconductor Electronics-1956 $8 Excellent

Television Handbook (Sam's)-1959 $8 Excellent

Heathkit Catalog Fall 1972 $13 Excellent

Heathkit Catalog - Winter 84-85 $10 Excellent

ARRL License Manual -1954 $5 Excellent

Radio Shack Catalog-1963 $15 Good back cover torn

ARRL Course in Radio Fundamentals-1948 $10 Excellent

ARRL License manual -1957 $5 Very Good

ARRL FM and Repeaters - 1972.....$8 Very Good

ARRL- The Mobile Manual for Radio Amateurs-1962.....$10 very Good

Fifty years of ARRL - 1964.....$15 Very Good - This book is a reprint
of Historical Articles - a really neat book!

Your VHF Companion 1996 ARRL Book - $5 Excellent

Some of the paper cover books have a bit of wear on the covers but the
insides are excellent unless indicated.

Source record: 19776

Greetings

Our local amateur radio club is trying to get onto irlp. And we have been running into our share of problems... Two of them have been radio oriented...

The first radio they tried was an 227... the second radio they tried was an icom22s...

I have the icom 22s now on the bench... I was given a schematic, which upon openning up the radio, about a hour ago, found that the schematic is for a 22 and we (I) have a 22s...

The audio output chips have different pins quantities...

The problem appears that there some wires, coming from the rear panel that, I believe, should go to the circuit board but end of in mid air... not connected... hence no sound...

Now what I believe is the audio output chip has the follow markings on it... nec e72e ... and ... 575c2... does anyone recognise this chip... I need to know what the pin out is... in particular what the audio output pin is. from knowing that pin I should be able to trace it out and see where the wire goes that goes to the speaker... make any sence?...

After that I may have more question...

If anyone knows where I can get, on the internet, the schematic of the icom22s that would be appreciated...

Larry ve3fxq

Do you have the assembly manual?...

If the power transformer is blowing... I must admit I don't have a schematic to follow.. can you disconnect the load from the power supply and see if the transformer gets warm... my rational is that the output capacitors might be leaking excessively and may need to be replaced...

I had a battery charger that frequently blew the bridge rectifiers until I removed the output capacitor.. after that the bridge ran quite cool... comparatively speaking...

Hmmmmm. Mayhaps you are correct?? The can doesn't say abrasive.. but it doesn't say it isn't either. I've been using Brasso on brass for a mellinium and it did/does work on things like Drake LP filters and other brass items. It will, of course, take the silk-screen markings off. I should have mentioned that... for sure.

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

Some people believe that belonging to a local church, temple, mosque or synagogue will get them to Heaven.

Others believe that water baptism, obeying the ten commandments or just being a good person will get them to Heaven.

There are many other beliefs as well, but the good news about God's way to Heaven is found in the Holy Bible.

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins. After Jesus was placed in a tomb He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Bible says, "For the wages of sin is death, but the gift of God is eternal life through Christ Jesus our Lord." (Romans 6:23)

This verse in the Bible says, "For ALL HAVE SINNED, and come short of the glory of God." (Romans 3:23)

This verse says, "But God demonstrates his own love for us in this: While we were still sinners, Christ died for us." (Romans 5:8)

In this passage the Bible clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

Salvation is not a reward but a gift. The Bible says it this way, "For it is by GRACE you have been SAVED, through FAITH and this not from yourselves, it is the GIFT of God." (Ephesians 2:8)

Nothing in the world is more important than your eternal destiny.

The Bible says, "In Him(Jesus) we have redemption through His blood, the forgiveness of sins..." (Ephesians 1:7)

If you have not yet made a decision to be saved, please do so now before it is too late. The reason why it is so important to be saved now is because you do not know exactly when you will die. You may die prematurely in a traffic accident, terrorist attack or some other way before you get another chance to be saved.

The Bible tells us that we will spend eternity in Heaven or a place of eternal torment called Hell. It would be terrible to die and go to Hell when all you have to do is accept Jesus Christ as your personal Lord and Saviour.

Some people that have already made Jesus Christ their Lord and Saviour worry about losing their salvation. The Bible teaches Christians that we can never lose our salvation no matter what happens.

The Bible says it this way, "My dear children, I write this to you so that you will not sin. But if anybody does sin, we have one who speaks to the Father in our defense Jesus Christ, the Righteous One." (1John 2:1)

Yes my friend, Jesus Christ is able to save you and keep you saved.

Please tell your family and friends, thanks!

Have a great day!

I worked for some time trying to replace a defective transformer in one of these units. Since I could never find a suitable replacement trans. I attempted to use two transformers to make up the necessary voltages..Not enough room, I gave up as a hopeless case.. The original transformer was so small,winding (wire size) was so small,they opened up after 20/30 years.Usually the 600 v winding goes out.. Good Luck 73 W4PQW

I'm not playing net-cop so much as logic enforcer. My News server trimmed your attachment before I ever saw anything, so it's nothing to me.

However, YOU have a few problems, and they could be illuminated just by you reading your own postings. You claim to be a long-term Usenet user, yet you jump in and post a binary to a non-binary group. This is equivalent to transmitting before checking the frequency. Doesn't say much for your courtesy, experience or common sense.

But your real problem is humility; you just can't say something simple like "oops, sorry". No, you have to hang in there and chew it death. And all the while, new issues keep being added and the hostility level is ratcheting up, and you're just displaying what an ass you are.

This isn't a good ol' boy issue; it's simply that this group doesn't easily suffer the rude, ignorant, profane and hostile.

Source record: 19783

Dear Friends,

This is my first post so please forgive me if I break any rules.

I have just picked up a Globe Chief 90 (not 90a) and would like to begin restoring it. The first thing that came to mind was replacing the filter capacitor which is 12mfd at 700v. I poked around and cannot seem to find any electrolytics in that voltage range that are not the size of a beer can.

Can any of you recommend a method of substituting multiple capacitors to make up this electrolytic? Is there a source of these that I've overlooked? I haven't checked it yet to see if it was bad but I'd just feel better proceeding with this project with a fresh filter capacitor so I don't destroy the power transformer.
Thanks for any help you can give me,

73,

Derek

I believe Hammond now makes an appropriate replacement transformer. Yes,
the power transformer is blown on a _lot_ of old Heath scopes. For the
cost of a Hammond, though, you can get a nice Tektronix at a hamfest.

There is a fundamental business principle involved. Since the mid 1990s the big push has been to get people to go to _websites_ and participate in chatrooms and blogs where four things are important: i) your contributions can be (and often are) censored (your post will not be seen if they don't like you and this can be automated), and ii) if you go to a website, then the advertising will be _in your face_ and that makes them money, and iii) they own and control everything on that website, and iv) they can put cookies, tracking cookies, spyware, and even trojans (directly or indirectly) on your computer.

On newsgroups, the whole mechanism of propagation, posting, reading is _free_ and very difficult to _control_ (unless the NG is moderated, or hacked) or monitor. Viewing and/or reading newsgroups: nobody can put a cookie on your box, you can lurk anytime you want and you can't get a virus (etc) unless you deliberately and voluntarily download an attached file on a post (eg. in the binary NGs) or an encrypted part of the text of the post (eg. warez NGs).

There is enough commercial incentive to "encourage" people to spend less time on NGs and more on chatroom/blogspace because they can track you, advertise to you, and collect more information on your behavior (so it goes into databases and that information is sold and traded in commericial environments. The govt "spys on" us, too.

AOL is like George Orwell's "Big Brother" (read the book "1984"). You have to get to (maybe) google.groups.com but even they don't have them all and sometimes the messages are not propagated as well.

Best is getting a shell unix account and learning half a dozen unix commands. Its not that hard. I stumbled onto this all about 15 years ago.

If you are interested, go to http://godos.freeshell.org for more information on shell accounts. And, links to ISPs and URLs for shell accounts. Some are free, some are very low cost, some cost much more. I pay $32.50 per month for mine (I'm not posting from it now, but telnetting

to this domain from my panix shell account) and its worth every penny of that. A good shell account is a very powerful access to the internet and you can run executables on their machine. www.panix.com also has terminal dialup; hackers can't get on your box if you live in an area where you can use their terminal dialup instead of ppp dialup (or cable, dsl, etc).

You can also go to http://freeshell.org or http://sdf.lonestar.org and learn more about SDF's ISP capability. They have their own national dialup now.

Derek, The capacitors that you mentioned are indeed hard to find..
Good news is,, newer capacitors are a lot smaller and more reliable..
Take two 30MF. 450 volts caps and series them ,total will be 15 Mf at
900 V .. I would place a 80 or 100 Kohm resistor at 5 watts across each
cap. to equalize the voltage across each..By the way You can use 40 or
50 MF caps ,this will give you more filtering,better filtering ,which
is a plus..GL 73 W4PQW

You took the words right out of my mouth.
So, I'll add something. There is a school of thought nowadays that says
that newer off-the-shelf caps are so consistent that the equalizing
resistors aren't really necessary. That may be true...today. Modern
caps don't have a history of how well they hold up over the years so its
always a good idea to use the resistors even if "it works great" now
without them.

Hi Harold,

Thank you so much for you good advice. I'll get those caps on Monday and hopefully have some progress to report by mid-week. You are very kind to help me with my project.

73,

Derek

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

Some people believe that belonging to a local church, temple, mosque or synagogue will get them to Heaven.

Others believe that water baptism, obeying the ten commandments or just being a good person will get them to Heaven.

There are many other beliefs as well, but the good news about God's way to Heaven is found in the Holy Bible.

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins. After Jesus was placed in a tomb He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Bible says, "For the wages of sin is death, but the gift of God is eternal life through Christ Jesus our Lord." (Romans 6:23)

This verse in the Bible says, "For ALL HAVE SINNED, and come short of the glory of God." (Romans 3:23)

This verse says, "But God demonstrates his own love for us in this: While we were still sinners, Christ died for us." (Romans 5:8)

In this passage the Bible clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

Salvation is not a reward but a gift. The Bible says it this way, "For it is by GRACE you have been SAVED, through FAITH and this not from yourselves, it is the GIFT of God." (Ephesians 2:8)

Nothing in the world is more important than your eternal destiny.

The Bible says, "In Him(Jesus) we have redemption through His blood, the forgiveness of sins..." (Ephesians 1:7)

If you have not yet made a decision to be saved, please do so now before it is too late. The reason why it is so important to be saved now is because you do not know exactly when you will die. You may die prematurely in a traffic accident, terrorist attack or some other way before you get another chance to be saved.

The Bible tells us that we will spend eternity in Heaven or a place of eternal torment called Hell. It would be terrible to die and go to Hell when all you have to do is accept Jesus Christ as your personal Lord and Saviour.

Some people that have already made Jesus Christ their Lord and Saviour worry about losing their salvation. The Bible teaches Christians that we can never lose our salvation no matter what happens.

The Bible says it this way, "My dear children, I write this to you so that you will not sin. But if anybody does sin, we have one who speaks to the Father in our defense Jesus Christ, the Righteous One." (1John 2:1)

Yes my friend, Jesus Christ is able to save you and keep you saved.

Please tell your family and friends, thanks!

Have a great day!

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

Some people believe that belonging to a local church, temple, mosque or synagogue will get them to Heaven.

Others believe that water baptism, obeying the ten commandments or just being a good person will get them to Heaven.

There are many other beliefs as well, but the good news about God's way to Heaven is found in the Holy Bible.

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins. After Jesus was placed in a tomb He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Bible says, "For the wages of sin is death, but the gift of God is eternal life through Christ Jesus our Lord." (Romans 6:23)

This verse in the Bible says, "For ALL HAVE SINNED, and come short of the glory of God." (Romans 3:23)

This verse says, "But God demonstrates his own love for us in this: While we were still sinners, Christ died for us." (Romans 5:8)

In this passage the Bible clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

Salvation is not a reward but a gift. The Bible says it this way, "For it is by GRACE you have been SAVED, through FAITH and this not from yourselves, it is the GIFT of God." (Ephesians 2:8)

Nothing in the world is more important than your eternal destiny.

The Bible says, "In Him(Jesus) we have redemption through His blood, the forgiveness of sins..." (Ephesians 1:7)

If you have not yet made a decision to be saved, please do so now before it is too late. The reason why it is so important to be saved now is because you do not know exactly when you will die. You may die prematurely in a traffic accident, terrorist attack or some other way before you get another chance to be saved.

I thought I heard a while back that the Viewstar product line was sold to
B&W in the USA.
They briefly made the amp under their own name.

You might contact B&W to see if they still stock parts.

515. manual for icom 22s

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-30 14:00:39 UTC
From: larry <larya@rogers.com>
Message-ID: <if2dnUTw9atjdWHcRVn-2w@rogers.com>
Source record: 19702

Greetings again..

I found the problem with the audio output chip, so that problem has been solved...

Does anyone have a copy of the icom 22s.. this is the diode matrix version. the manual I have, ic22, has the crystal board version..

I am looking for someone who has a computer scanner who could scan the schematic drawing and email it to me. My photo program and scanner can handle .tif and jpg formats and possibly other but I am only familiar with those two..

If you can, would you scan the page and send it to me uncrushed.. I scanned a blank, 8.5 by 11 inch page and it took about 120k.. my isp can handle that...

I was a Christian once, but then I "got saved." :-)

Now I'm a Frisbeetarian. We believe that when you die,
your soul flies up on the roof and you can't get it down.
Unless you're bad, then the Devil Dog jumps up and
snatches you out of the air and takes you under the porch
for a good chew.

Hey- makes as much sense as anyone else's religion!

Hello again..
Try the website below,it has the manual and schematic in PDF form.
I found this by typing :IC-22S schematic in Google and searched under
groups.The schematic is not easy to read, but it is better tham none.

Hello,
Does any one know of a source for the cabinet paint for the National NC-270 (also NC-155, NC-190 etc.) receiver?

The faceplate is the 'cosmic blue' color, but the National cabinet is somewhat turquoise.

Thanks.

I'm trying to identify some (tubes?) I got in a old beat-up piece of equipment, and I would appreciate any leads. They have an octal base, a grey metal envelope about 2" high, and are heavy as lead. The manufacturer is "Voycall", and they are labeled "A50"
Anyone have any idea what these are?

524. WTB- front panel (faceplate) for the Heathkit SB-303 receiver

530. WTB: part for SP-600

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-01-30 23:19:22 UTC
From: Jim Mandaville <zygo@azstarnet.com>
Message-ID: <zygo-4907B5.16192230012005@corp.supernews.com>
Source record: 19719

I need a replacement, used or new, for a small rotary switch on my SP-600-JX-6. The part is called "S-3" on the schematic and in the manual. It is the switch, mounted near the top of the gear train plate on the right, that connects the fixed-frequency oscillator and crystal bank to the VFO circuit when crystal control is selected as the operating mode. Actually the mechanics are okay on my switch, and a replacement wafer alone would do the trick.

With hope, Jim, KF7A

I think that the first thing to do is to ask yourself: "What would Leo Meyerson do".....

Well.....I would buy the cheapest under-rated capacitor from an el-cheapo surplus house, then cobble it in with a 200-watt soldering iron. Hit the plate switch and pray that the cardboard-tube plate coil doesn't melt down or that the whole transmitter doesn't go up in smoke.

Seriously, the advice by the aforementioned folks should guide you in the right direction. Good luck and.....as any owner of a Globe transmitter knows.....GLOBE stand for:

Dear Friends,

This is my first post so please forgive me if I break any rules.

I have just picked up a Globe Chief 90 (not 90a) and would like to begin restoring it. The first thing that came to mind was replacing the filter capacitor which is 12mfd at 700v. I poked around and cannot seem to find any electrolytics in that voltage range that are not the size of a beer can.

Can any of you recommend a method of substituting multiple capacitors to make up this electrolytic? Is there a source of these that I've overlooked? I haven't checked it yet to see if it was bad but I'd just feel better proceeding with this project with a fresh filter capacitor so I don't destroy the power transformer.
Thanks for any help you can give me,

73,

Derek

The work on the Boyer estate auction goes on.
Last Sunday afternoon we generated a stack of auction item cards.
Robert Lozer has really put in the effort and has gotten all of them logged
into the club db and we now have a list of most of the Tubes and
Paper items that will be auctioned in the Thursday evening
auction.
You can see the list 312 items here,
http://cc_awa.homestead.com/auctionlist.html
You'll note that the auction item number is included in the
list to help you keep track of those items you may
be interested in.

NOTE, this is 312 items just for Thursday evening.
This does not include all the radios that will be sold
on Friday afternoon.

This may be the biggest radio auction of the decade.

DON'T MISS IT ! ! !

Ron

It does see silly that they would claim the forum was only
for those with a license. Both made stand alone receivers, including
some that weren't just for the ham bands. The post did not say
the forum was only for ham equipment, it simply claimed one had
to have a license to participate in the forum.

If keeping the riff-raff out was the policy, surely the fact that
much of that equipment is now old and expensive is the filter; one
has to have a level of capability to talk about such equipment.

Not the problem - it's the arrogance of *some* hams (some of my best friends are hams ;>) then there's the *others*.

Dunderhead?
FCC 1st since 1966 - added RADAR in 1978 - smallest transmitter currently on the air - 5KW (WMER 1390 AM)...

Collins? start with an R-391 - closet full of 390 390A 391 spares (OK so my 390A is a Capehart)- 40 years experience - code - yeah - 60 67 75 & 100WPM flying iron (greenkeys)- 15WPM - what a waste of bandwidth...

yeah - I'm just a dunderhead - can't comprehend nothin'

If you can't find another source, you can bring your cabinet to an auto paint supplier and ask them to make a color match, then prepare a spray can(s) for you. Note -- this is not an auto parts store. It is a business that supplies paint to auto body repair shops. The last time I did this, it cost about $25 and they included a pint can with a lot of the same paint left over.

I have a chance to get a Palomar Elite 300 linear amp CHEAP! Is this thing any good? I haven't been able to find any information on it and it doesn't come with a manual. The questions I have are:

Is this amp good for HF Freqs 10 meters down to 80 meters as the seller claims?
What purpose does the preamp serve?
With a boost in transmitting power, how will this affect receiving?
Would I be transmitting further than I can actually receive?

Sorry for the dumb questions. I have absolutely no experience with linears, and this little amp seems too good to be true, so it probably is! :)
Anyone know where there's information online for this amp?

Thanks!

Perhaps e-Bay has something to say about this......

"...Shill bidding is the deliberate use of secondary
registrations, aliases, family members, friends,
or associates to artificially drive up the bid
price of an item. (This is also known as "bid padding.")
Shill bidding is strictly forbidden on eBay.
eBay members found shill bidding may receive
warnings or indefinite suspensions of their accounts."

Because Heath used some of the crappiest suppliers for some of their transformers. If you wind a HV winding with very fine wire, and allow any of the individual strands of wire to pull tight, when the transformer gets warm and expands, the wire will be stressed and eventually break.

There is nothing you can do short of rewinding or replacing the transformer.

-Chuck

Yes, I had a feeling about that and confirmed it earlier today. Thanks Alan. I never got a chance to actually look at the amp close up so I knew very little about it, including its FCC status. There's no cheap way around this so guess it's back to HRO or Universal Radio.

Greetings! I don't believe that it will go down to 80 meters. The ones like it that I have seen will generally go down to 40 meters. The pre amp is for receive purposes only, and is generally the first thing to go on these type of amps. They are made for the eleven meter crowd and that is where they do best. I don't forsee any real change in your reception with the amp. It has a low input of probably no more than 10 watts. What transiever are you planning on using it with? I think its best use for you would be on ten meters with a QRP setup. You may be able to get this one cheap, but you need to determine which bands you would want it for and do some more homework on it first. Copper electronics is the big seller of these things. You might be able to get some more info there. If I were you I would save my money and get something actually designed for amatuer radio use. Jon.

Cinch Connectors North American unit is based in Lombard, IL (western suburb
of Chicago). Cinch is part of Snecma which is globally headquartered in
Paris, France. Cinch still makes the 300 series connectors (known to
amateurs
as a Cinch-Jones plug) and you can also find it manufactured by Molex (also
a Chicago based company).

Here is the Internet based Cinch connector catalog (Adobe Acrobat)
http://www.cinch.com/products/pdf/Commercial_PDF_Catalog_20031223_1105am_pdf_file.pdf

You can purchase this connector from a number of Cinch Connector
US distributors: Mouser, Allied, Newark, Sager, ECCO, Arrow, Carlton-Bates
as well as a number of foreign dealers and distributors of Snecma.

Almost certainly a design problem. Heath was not exactly known to use
the highest quality parts in the first place. I suspect that it's a matter
of insulation breakdown on the high voltage winding, so that a PTO
thermistor in series with the primary to reduce inrush current won't
help much.

Look at some of the military gear out there. Fair Radio has a wide variety of low-band VHF sets that will cover 6M. The PRC-25 is a personal favorite but there are a lot of vehicle-mounted sets that are better performers and cost less.

So you can't tell when he shills up his own bids under another id and so
no one can email bidders and clue them in about his fluffed up
descriptions of items he has "had in his collection for years" even
though he only purchased them recently on ebay under his other id.

Message-ID: <98qdnaA_x4rmV2LcRVn-qA@rogers.com>
Source record: 19661

Greetings, again...

One of the responders, to this message, was kind enough to send me a .pdf file of the icom 22s schematic... again, to him, many thanks..

From this schematic I learned many things about differences between the 22 and 22s...

Now I need the component and conductor drawing of the 22s... I know that the transmitter is being keyed, when the ptt which is depressed but there is no audio being transmitted... I also discovered that the +duplex and -duplex functions are not taking place... the audio turn on and the duplex function may be originating from the same ptt function...

Does anyone know where I can get the print circuit board layout for the conductor side and component side for the main circuit board for the icom 22s transceiver??

Probably relays (often supplied in tube sockets), and probably with
high-pressure nitrogen and maybe mercury-wetted contacts inside -- don't cut
one open to see :-)

Did anyone make transformers in that configuration?

>back to the drawing board :)

Best to run the oscillator continously (while transmitting) and just
key the finals. And then figure on some key click filtering.

Source record: 19673

I have a mercury-wetted relay by C.P. Clare that is close to your
description. The coil is pins 7 and 8 (600 ohms for 28 VDC),
the common contact is 3, normally closed is pin 5,
normally open is pin 1, and there's a jumper
between pins 2 and 4.

Even though it's a relay, the octal base says
"Licensed only to extent indicated on carton",
same as an octal tube.

In this case it is probably a frequency-dependant relay for a selective
calling system.

>Did anyone make transformers in that configuration?

Yes! Altec did, as did lots of other folks.

Ssshhhh!
Actually its kind of funny. As you know the dial readout on the ARC5 is
fairly precise and easy to read. I was very paranoid about using the
VFO and only used about 5 particular favorite frequencies for fear that
"they" would hear me all over the band.
Seems so silly nowadays with CBers raising havoc scot-free from 24-29 Mhz!

His "collection" should be translated "stuff I got on eBay recently and think I can make a quick buck from."

His stories about the history of anything he sells seem to me to be fabricated. He claimed to me several years ago when he won an auction of mine on eBay and a few weeks later listed the same item saying it had belonged to his father and was in his family for years, was that he was from the UK and had a radio store there. He said he also had a Texas US call and spent a lot of his time in the US. When I challenged him on his description of the item that he was auctioning that he had just got from me was that he was just trying to make it more interesting.

Probably also fabrications about his call sign and perhaps his UK connection though with a name "Martyn" it's not a typical stateside spelling.

Deal with him with caution.

Mike, your enquiry has triggered me off again.

An English "skivvy" is, or was, the lowest of the low domestic servants - the teen-age girl who lived in the attic or cellar and emptied the bed-chamber pots in English Gentlemen's Victorian and Edwardian large houses.

The breed died out during and shortly after the "Great Leveller" - World War One - from which the sons of the family did not return. The Empire was in decline. Due to loss of income the impoverished gentry could no longer afford to employ so many servants.

Skivvies had to go. Working-class young women became employed in dark, filthy Black Country factories at 20 shillings per week pocket money until they became pregnant and got married. Then came WW2 and the air raids from which I returned better educated and intact.

In this better age even the chamber pots have gone. Although I still have a large heavy antique relic which was in regular use by my grandmother. As a child I once saw her sitting on it. Should fetch a good price at an auction.

Reg.

I've read all of the postings on this subject and like so many of you I have no idea why anyone would use AOL as an ISP. That aside let me tell you this story about how brain dead AOL is.

My wife's cousin died. He used AOL. He did because he was computer illiterate. So be it. Anyhow, in November he died unexpectedly at 62. So my wife and I proceed to shut down his accounts, one of them being AOL. Each time we called to get the account shut down we ended up speaking to at least six people, and twice we ended up with the same person who took the call. To make a long story short, on the last call I got so angry with them that I damn near shouted at the person. They kept saying that Mr. Shepard had to call and cancel. It was at that point I raised my voice and said, "He is D-E-A-D. He is NOT with the living any longer. He has met with his demise. His heart stopped. He has been CREMATED and CAN'T CALL. What part of D-E-A-D don't you understand?" To wit, the individual on the other end of the phone, the one with a Room Temperature IQ, said. "I understand, but, you will have to have Mr. Shepard call and cancel the account." I laughed to myself and said, "I've have him call you at his earliest convenience. Thank you for clearing this up for him." I hung up, shut down the credit card it was billed to and forgot about it. Like what are they going to do ruin his credit? Tim

In a reply to an e-mail I received from a reader of this group, I wrote the following:

I have been a user of newsgroups since early 1991. Most users today are not aware there was an internet then! We did not have Netscape, Internet Explorer and Mozilla then. We relied on many other means to access the internet. At that time, as is customary today, binary files continue to be posted in many usegroups. Just because I was new to this paticular group, I was hammered because I posted a genuine post asking for some help. What did I get besides flames? There are some who replied to my question without showing their bottom side and to them I give many thanks.

The usegroups are free for all to use and under the control of no one individual or group of people. It was devised to operate in this manner to prevent the very thing that happened to me from happening! Those guys are just showing their true colors and I now realize they are to be ignored and placed on the refuge heap with their comments!

Thanks,

Trent

Greetings again

Well I seem to have gotten back my transmitted audio, though it is quite distorted... I will work on that shortly...

I have been noticing two wires which end in bar wires.. they seem to be coming from the same ribbon cable that goes to the diode matrix board. does anyone know where they came from and when they are supposed to go?

I've spent many years with these rigs.
If you have removed the relays and done the usual "hamming"
modifications, getting rid of all the chirp may not be possible.
Chirp is addressed about half way through all this.
The "standard" ham modification is a very bad one.

Here is a "replay" of a couple of posts I made
to other lists that some have found useful.
Chirp is addressed about half way through all this.
I hope they may provide some help.

The only "modifications" needed to a Command transmitter
are simple and 100% restorable.

1. Replace the three capacitors in the bathtub on the back.
Even if you think they're good, they're bad. Trust me on this.
Leakage in this bathtub cap causes big headaches,
and if it isn't leaking now, it will be.
Here's an easy way:
Unsolder the leads of the bathtub cap, leaving the wires intact.
Make sure multiple wires stay connected to each other, just not the cap.
Coat them with insulation. "Liquid Tape" by GC is good and available
at most electronics parts places, or just use tubing.
Leave the wires where they are as their distributed capacitance
is part of the design.
Get some of those little mylar .047s from the parts house.
They're about the size of a pencil eraser. Trace the wires from
the bathtub to where they connect, then solder the cap between
there and the nearest ground.

2. Unsolder one lead from the antenna relay. Roll the spring
contact from the loading coil around so it's always in contact.
Either put some Cramolyn on this contact or polish it as
detailed below.

3. Check the selector relay and make sure that the osc. B+
contact (the "short" one, nearest the coil)
makes before the 1625 cathode contact. Carefully bend

them to make sure. You key the rig with this relay
through it's contact on the back plug- it's called the "selector."
Put a "spike killer" diode across the relay coil winding
(anode to positive voltage lead) to keep the inductive
kick off the filaments and keying leads.

That's it. All the hole drilling and output hacking and
"de-TVIing" of the 50s and 60s was completely unwarranted.

If you want to make it easy to tune and remove
a source of possible "chirp," the next steps are
some work, but well worth the effort-

All the roller coil assembly metal parts (less screws)
are plated in silver. This gets oxidized (that black stuff).
When you're loading the rig, you'll notice "intermittent" power
out as you roll over the gunk. If your loading point is
cruddy with this black stuff, it will heat when you key
and change the loading enough to introduce some chirp
(yes, believe it or not).

Go to Wally World and get some cream silver polish.
Don't waste your money on the "dip" stuff.
Put a towel or other "parts catcher" on your bench.
Completely disassemble the roller coil unit.
Pay close attention so you can get it back together
in the right order.
The leaf-spring contact on the coil axle (ceramic support end)
needs to go back right-side-up, so you might want to mark it
or just notice how it goes back in.
Use a linen or other lint-free cloth to polish the coil,
roller bar, roller, axle leaf spring contact etc.
Use a "Q" tip to polish the inside of the roller wheel as well.
Once all the crud is polished away, rinse off all the polish
with clean water and allow the parts to completely dry-
especially the coil. Don't want water under the turns.

As you reassemble, lubricate the thumb-wheel end and thumb-wheel
axles with petroleum jelly or graphite. Do not lube the
ceramic-to-coil joint, but do lubricate the roller coil axle and
leaf-spring contact with paste Cramolyn or other
good contact lube. Be careful not to overtighten the screws
that are threaded into the ceramic.
Just finger-tight them and lock them in place with some
paint or fingernail polish. Seal the roller-bar screws
with paint as well. Now enjoy easy tuning.

On "chirp-" This is a classic MOPA rig. While you can expect
some small amount of chirp, I've got many transmitters in which
it is difficult to hear any at all. I've never had one that,
after I finished restoring it, had what I call "bad" chirp.
Noticeable chirp in an "ARC-5" transmitter

can usually be traced to a few sources.
Here they are in order of their usual appearance:

1. Poor power supply regulation.
Your supply needs guts enough to maintain 500-600 VDC at 200 mils
and 24 VDC at about 2.5 amps.
(if you don't want to use DC on the fils, put a diode and
filter cap at the relay)

2. Leaky bathtub caps. Reduces osc. drive, messes with
Osc B+, reduces grid bias to the 1625s. See above.

3. Cruddy output tuning network or antenna connections.
Anything that changes the loading- like heating the crud
between the roller and coil-
is going to pull the freq of an MOPA rig.

3. Low under-load emission in the 1626 Osc.
Swap it out with a known-good one.

4. Grid emission in one or both 1625s. Especially
noticeable in one that's been run at 800+ volts.
Swap with known good ones.

I've seen changed resistor values in the osc. stage
and misc. other stuff, but these four are the usual bandits.
While I've heard of the other mica caps going bad, I've
worked on many dozens and never seen it happen. I've
also never seen that custom "button" cap in the MO stage go bad.

I hope this will help out.
Next post for the power supply.

73 DE Dave Stinson AB5S

On an ARC-5 Power Supply:

First- there are three "flavors" of transmitters commonly
lumped under the name "ARC-5"
The first is the Navy ATA, second is the Army SCR-274N
and last is the Navy AN/ARC-5.
The rear connectors and wiring for the ATA and SCR-274N
rigs are identical. The AN/ARC-5 connector is
physically different and the wiring is also somewhat different.
If your transmitter is black wrinkle painted and
has a big RF choke next to the tank coil, it's
AN/ARC-5. If it's black and has not such coil,
but has an anchor in yellow paint on the back skirt,
it's an ATA. If it's silver, it's a later SCR-274N.
If it's black, has no RF Choke and has a "BC-4xx"
number on the back skirt, it's SCR-274N.

Transmitter Plug Pin-out:
(Note: If yours has an octal socket or anything
other then the 7-pin Mica connector,
then it's a modification and all bets are off.)

For AN/ARC-5-
There are seven pins. The pin in the center is
pin #7. Locate the pin that is grounded
to the chassis. This is pin #4.
Count the others *clockwise* around accordingly.

1. No Connection
2. +200VDC for the Osc. (needs to be right for stability).
3. Keying Relay (ground to key).
4. Ground.
5. A+ 24-28 VDC.
6. PA Screen Voltage (use 20K 5W dropping res. from B+).
7. PA Plate B+ Voltage +550VDC

For ATA/ARA and SCR-274N:
There are seven pins.
The pin in the center is pin #7.
Locate the pin that is grounded
to the chassis. This is pin #1.
Count the others *clockwise* around accordingly.

1. Ground
2. Test point for PA grid current.
3. +200VDC for the Osc. (needs to be right for stability).
4. PA Screen Voltage (use 20K 5W dropping res. from B+).
5. Keying Relay (ground to key).
6. A+ 24 VDC.
7. PA Plate B+ Voltage +550VDC.

The best way to get power to the rig is the way the
original engineers intended. I don't mean a dynamotor-
I mean a good, solid 550 VDC source and a divider.
Both the AN/ARC-5 and SCR-274N units derive their voltages
using a voltage divider network. We'll draw a divider that
matches the one used in the original power supply.
I very much recommend it.

Primary power should be 24-28 VDC at about 2.5 amps for relay
and filiments and B+ of 500-600 VDC at about 200 MA.
We will assume the designer's specs of
550 VDC B+ and 26 VDC filiment.
Get a pencil and a piece of paper. Follow along:

Place a dot on your paper and call that point "A".

Draw a line right to point "B".
From point "B", draw a line down and

connect a 20 K-ohm, 5 watt resistor here.
Call the other end of this resistor point "C".

Draw a line right from point "B" to point "D".

From "D", draw a line downward
and connect a 15 K-ohm, 10 watt resistor.
Call the other end of this resistor point "E".

>From point "E", connect a 100 K-ohm 1 watt resistor to ground.

Draw a line right from point "D" to point "F".
Draw a line right from point "E" to point "H".

+550 VDC in at point "A".
+550 VDC out to PA plates at point "F".
+270 VDC out to PA screens at point "C".
+200 VDC out to Oscillator at point "H".

Bypass all outputs with about .01 ufd to ground.

If you wish to regulate the screens for AM,
connect an 0D3 VR tube with a .5 ufd at 300VDC
cap across it between point "C" and ground.
This will bring the screen down to 150 volts.

If you use this network, and use correct antenna
matching, you will be able to properly load and
tune your command set transmitter to rated output.

Voltages lower then 550 VDC will work just fine
with the same network. Voltages much higher will
cause MO drift and increase chirp.

Antenna matching:

The "ARC-5" transmitter is not designed for a 50-ohm
antenna. It is designed for a 5-12 ohm aircraft antenna.
Doing it the "ham" way- turning the loading coil
to zero and the coupling to max- makes harmonic
rejection ineffective and does not allow maximum out.
To feed a 50-ohm antenna on 40 meters, the best thing
to do is to put a 200-pf variable cap between
the antenna post and your coax center conductor
(If you're using a "random wire," it will feed it if
it isn't close to a multiple of a 1/4 wave.
p.s. A "random wire" is a really lousy antenna).

If you don't have a good 200 pFd variable,
to get "in the ball park," insert a fixed 50 pF,
1000 Volt or better NP0 (no thermal drift) capacitor
and tune up- you'll use about a quarter to a third
of the roller coil and the link will be between

40 and 75 percent, depending on the exact model
of your transmitter. Vary the value up or down
to get best power out.
Clean that roller coil and tuning will be
much easier.

It is indeed FM... sorry, I didn't see the "AM" part of that. But a lot
of it is narrowband, or can be adapted for reduced bandwidth without too
much work.

I like FM, though.

The >indicators run on little elevators that can go up in one direction, and down >in the other. When an elevator hits the top floor, there's only one >direction to go, and vice versa :-)

The Hammarlund SP-600 has an "elevator" pointer, but it seems to be cam-driven, so it goes all the way up or donw in a hurry when you roll over the band selector. Of course, it almost takes two hands to turn the mechanism :-)

BTW, I would want the limit stop detents place up front by the knob, not in the rear of the bandswitch, so a real gorilla type wouldn't over-torque the switch shaft.

Just my two cents -- Mike K.

But someone may be looking for AM because they want to sample that, not
because they just want to get on six meters.

Traditionally, that military surplus FM equipment for six meters
would get converted to AM, at least for receive, up until the point where FM
took off on the band, at which point there were all those articles about
modifying six meter AM ham transceivers for FM.

Source record: 19594

Thanks, Jon. There's a lot of confusing information on the web about FCC rules regarding amps. My understanding is that in the U.S. you can't have a linear amp with less than 50 watts drive power? I have a 10 meter mobile rig running off a power supply at home with 10 watts AM and I believe 25 watts SSB. The palomar does not meet these drive rules (5-25 watts), plus I seriously doubt it was issued an FCC type acceptance, so it would be illegal to use it. I could be wrong here, so please correct me if I am.

So it seems I can't put ANY type of amp on my 10 meter rig because of it's low power. I may as well pack it away until the sun cycle improves. It's pretty useless the way things are now, but damn can it reach out when the sun activity is favorable! (RCI-2950)

Also, I heard these black market amps are really dirty as far as interference goes. I definitely don't need to be upsetting the neighbors. They wonder about enough as it is. :-) I woldn't blame anyone for using this amp for QRP, but its dirty output could really create problems not only with the neighbors but with the FCC.

I also heard this amp is a real current hog - at least 20 amps when set on low (it's obviously not very efficient).

So, I agree with Jon that if I were to buy a linear amp, the extra money for a good quality, reputable brand amateur radio amp is money well spent. Clean, efficient operation really costs, though!

Glad I posted this, as I totally forgot about the minimum drive power rule. Doing your homework can really pay off sometimes. :-) Thanks to all for your help and advice.

You can get orange drops at almost any local electronics store,
although I've usually bought mine from Antique Electronics of Tempe,
Ariz. The company has a Web site.

I don't think type acceptance applies to equipment applied for Amateur Radio use.....think of all of the hams that have built thier own amplifiers. Drive power also shouldn't be an issue.....if you have a QRP rig, you should be allowed to design your own amplifier or use a commercial amplifier that has low drive requirements. Using it on 11 Meters is a different story, but the Amateur frequencies should be an exception. I don't use the myself, instead, using a barefoot 100 watt rig on the HF bands, it eliminates the "other box", but everybody has preferences.....

Greetings

Can someone please tell me what size allen key wrench is needed to unlock the channel change knob on the icom 22s. I don't have the size and it would be nice to be able to go to the hardware store and only buy the size I need rather than a pack of allen keys most of which I probably don't need.. I do have some allen keys but not the right size..

Larry

609. Re: Palomar Elite 300 Good for 10 Meters?

Newsgroup: rec.radio.amateur.boatanchors

Source record: 19598

First, IANAL, but this is the internet, so here goes:

Type acceptance does apply to linear amplifiers commercially "made for amateur" use. There are requirements that the amplifier not be usable above the 15 meter band, and not be usable with drive levels below 50 watts. There are also rules about how far below carrier the spurious emissions must be. In order for a commercial entity to sell a linear amplifier for amateur use, in the US, it must be type accepted.

The Palomar Elite is a commercially built linear amplifier that was not type accepted. As a result, the sale of the linear amplifier in the US was illegal. Any use of the linear amplifier (amateur or otherwise) is also illegal.

When Heath sold the SB220 and other linears, after the law came into effect, they made the amplifiers only work to 15 meters. You could buy a kit that would allow operation on 10 meters, but only after showing them a valid amateur radio license. Notice that these amplifiers were compliant with the FCC rules even though they were kits!

Now, for the other side of the coin: A licensed amateur radio operator may build and use *anything* he wants, as long as it meets the requirements for the service. He may also modify the radios from any service to be usable in the amateur radio service. So, if you have an 11 meter CB, and you modify it to operate on 10 meters, that is fine. If you want to build an amplifier that takes the 10W or so SSB from that transceiver, and boosts it to a full gallon, that is fine too.

The type acceptance laws only apply to the commercial manufacturer. The big question before the house is: can an illegally manufactured and sold product ever become legal to possess and use? The legal answer is probably not, in spite of the fact that it would be perfectly legal for an amateur to build such a product for his own use.

Decades ago, you'd open up the Lafayette catalog, and see amplifiers on
the CB page. They'd have relatively low output, but then they only required
5W drive. And they'd all say "Illegal for Class D citizen band use".

IN other words, they were being sold for such use, with the disclaimer
so Lafayette could at least say they warned people.

There were plenty of other examples.

So in the late seventies your FCC introduced a law to clamp down on
those amplifiers for illegal use. The issue wasn't to restrict amateurs,
the issue was that many an amplifier was using the guise of being
an amateur amplifier to cloke that it was intended for the CB market.

613. For Sale: Heathkit, Allied, Test Equipment, Transmitter and Receiver Parts

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-03 17:21:04 UTC
From: David Hollander <n7rk@cox.net>
Message-ID: <42025D80.5020703@cox.net>
Source record: 19602
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

Here are a some items for sale. Prices do not include shipping. I will
ship overseas.

Heathkit SB-634 Station Console.....$100 plus Shipping
Matches the SB-600 series. Includes a wattmeter/SWR bridge, a phone
patch, a 24 hour clock and a 10 minute ID timer. The clock, wattmeter
and timer all work as they should. Excellent shape and includes the
original manual.
http://members.cox.net/radiodx3/heath_sb6344.JPG
http://members.cox.net/radiodx3/heath_sb6342.JPG
http://members.cox.net/radiodx3/heath_sb6343.JPG
http://members.cox.net/radiodx3/sb6346.JPG

Allied A-2515 Receiver.....$135 plus Shipping
5 Band AM/CW/SSB solid state receiver that covers 150 kHz to 30 MHz.
These were built in the 1968-1969 time frame built for Allied Radio by
Kenwood Trio.This receiver is in excellent condition and plays very well
on all bands. Although designed for an external speaker, a speaker has
been added to the inside using the existing ventilation holes on the
top. This is easily removed if one should find the matching external
speaker. The screws for this speaker can be seen in the photo.

http://members.cox.net/radiodx3/allied_a25155.JPG
http://members.cox.net/radiodx3/allied_a25156.JPG

Dow-Key Relay.....$30 plus shipping
12 Volt dc with SO-239 connectors
http://members.cox.net/radiodx3/dowkey9.JPG

Dow-Key Clone Coax Relay.....$25 plus shipping
28 Volt dc with BNC and Type F connectors
http://members.cox.net/radiodx3/coax_relay5.JPG

National Type ï¿½Bï¿½ Dial.....$35 plus shipping
This is the same dial that is used on the National SW-3 receiver.
This dial is in great shape and includes the mounting screws on the
back. Great for a homebrew receiver!
http://members.cox.net/radiodx3/national_dial.JPG

Bud - Two Neutralizing Transmitting Capacitors.....$30 plus shipping
http://members.cox.net/radiostuff9/neutrcap.JPG
http://members.cox.net/radiostuff9/neutrcap2.JPG

485 pF Precision Variable Capacitor with Gear (Vernier)
Drive.....$20 plus shipping
Measures 15 pF min and 485 pf max. This capacitor is in excellent
condition. Nice capacitor for a receiver or a home-brew VFO project.
http://members.cox.net/radiostuff9/verniercap.JPG

Hewlett Packard HP 331A Distortion Analyzer.....$85 plus shipping
Clean working unit. No power cord.
http://members.cox.net/radiostuff9/hp331a.JPG
http://members.cox.net/radiostuff9/hp331a2.JPG
http://members.cox.net/radiostuff9/hp331a3.JPG

General Electric TC-1 1930's Tube Tester.....$60 plus shipping
Neat art deco looking unit from late 1930's. It tests tubes from the
1920's to beyond the 1930's as it has some updated tube charts. It will
test 6L6's, 6V6's, etc. It will test octal, 4, 5, 6 and 7 pin tubes. It
will not test any miniature tubes. The unit works great. The front
panel and case are in excellent shape. It includes instructions and tube
charts.
http://members.cox.net/radiostuff9/ge_tc12.jpg
http://members.cox.net/radiostuff9/ge_tc1.jpg
http://members.cox.net/radiostuff9/ge_tc13.jpg

Digital Precision 2440 Nixie Tube DVM.....$35 plus shipping
This unit will measure DC and AC voltage, and Resistance. This unit has
been tested and works. It does not include a power cord.
http://members.cox.net/radiostuff9/dp2440.jpg
http://members.cox.net/radiostuff9/dp24402.jpg

Batch of W.W.II Crystals.....$30 plus shipping
39 Crystals. See photo for frequencies. Here is a link to the frequency
conversion chart http://members.cox.net/n7rk/ft241_xtal_list.jpg
http://members.cox.net/radiostuff9/xtal_batch.jpg
http://members.cox.net/radiostuff9/xtal_batch2.jpg

Vintage Westinghouse Portable DC Voltmeter.....$35 plus
shipping
This meter in a heavy bakelite measures 0-150 volts and the ranges are
changed by making the appropriate connections to the meter. The ranges
are: 1, 5, 15 and 150 volts. This is a working unit in nice condition.
The instruction card on the inside cover has a date of 1942.
http://members.cox.net/radiostuff9/west_meter2.jpg

Thanks for looking.

It may NOT be an Allen screw, check very carefully (could be Bristol or
Torx).
This was about the time that Icom was using Torx screws on some pieces of
equipment.
It's been ages since I had an Icom 22S, but I do remember that they also had
bad Phillips screws (pot metal) .. and I barely was able to remove one
screw --
has to order a set of 4 screws from Icom -- and it took 4 months to get that
part in the late 1970s.

Let's flash back to the early '60's. I was a tender lad of 7 or 8, and
my folks had bought a house after renting for years. The previous owners
had left a number of things, including a beautiful porcelain pottery
piece which my mother started using as a cookie jar. Imagine her dismay
when she was told that it was a chamber pot!!!! She stopped using it,
despite my protestations that it's ancestry made it even "cooler".

To this day, I am amazed that such a fine piece of pottery would have
such prosaic purpose..... darn good cookies too!

I just picked up a Heath IT-18 transitor tester. The meter movement
appears to be burned out. (tested it extensively - took it right
apart and there is continuity right to the armature).
Would anyone have a spare one for sale.
It was made by Mercer Electronics in Mercer Wisconsin. Full scale
is 200UA. I'll even take an entire IT-18.
Best to email richard_parker AT sympatico.ca

Thanks
BL

I realize the type acceptance applied to commercially made equipment. However, I find it odd that a licensed amateur can build an amp that violates the regulations the commercial builders are required to follow. (I.E. Drive power) I'm not doubting it; just find it a little odd. :-)

Also, if I remember correctly, a licensed amateur can build ONE RF Amp in one calendar year. Anyone building more than one amp must apply for an FCC grant or type acceptance. (Again, please correct me if I'm wrong) I remember reading this in the ARRL handbook in the late 90's, that was over five years ago so this law may have changed.

Are there any ARRL publications, especially the handbook, which contain plans for a linear amp which will run on 5-25 watts drive power?

Licensed amateurs can do all kinds of things that commercial manufacturers
cannot do! You don't have to meet a lot of the electrical safety requirements,
even.

For a long time, commercial broadcasters were also allowed to use non-type-accepted
equipment as long as it had markings on the case saying who constructed it and
when, and certifying that it met the requirements of the type. BUT, they could
not sell such a homebrew transmitter to another station for use.

>Also, if I remember correctly, a licensed amateur can build ONE RF Amp

I don't remember that at all but it may well be true. I recently built a receiver
which had ten RF amp modules in the IF strip. Does that violate the requirements?

>Are there any ARRL publications, especially the handbook, which contain
>plans for a linear amp which will run on 5-25 watts drive power?

Probably some of the older ones do. I know that QST once did a project on
an amp for the ARC-5 sets.

But this is because the rules are about commercially manufactured
amplifiers, not general rules that apply to the amateur service.

Again, we are not talking about laws intended for hams. This amplifier
law is about amplifiers that are illegally used for cb or bootleggers.
The only reason it impacts on amateur radio is because there is no real
way of making an amplifier that only works on ten meters, and not at
all on adjacent frequencies.

How do restrict amplifiers that use to be labelled "illegal for Class
D Citizen Band use" even though they were on the same page as the CB sets?
Well, you can start by requiring drive power that is higher than CB
sets put out. Yes, hams can require amplifiers that use little drive, but
generally it was easy to see from the drive specs what amplifiers were
intended for illegal CB use.

Put in rules that do not allow amplifiers that cover the frequency range.
Hence the elimination of 10meter position on amplifiers intended for ham
radio.

And so on, for whatever the rules state exactly.

The rules will be a problem to some hams, but relatively few. Only a handful
will need low drive requirements. Since it's amateur radio, the individual
has a greater chance of knowing how to fix the problem of no 10meter band on
the amps. And of course, since it's amateur radio, they can always build what
they need. The rules haven't changed amateur radio, they've changed the state
of commercial amplifiers.

> Also, if I remember correctly, a licensed amateur can build ONE RF Amp

> an FCC grant or type acceptance. (Again, please correct me if I'm
> wrong) I remember reading this in the ARRL handbook in the late 90's,
> that was over five years ago so this law may have changed.
>
That's because you have to define "manufactured". If an individual can
make an amplifier and sell it, then it bypasses the issue completely,
because it still makes amplifiers available for illegal use. One amplifier
a year (and it may specifically say one of the same design), should not

be a hardship for a ham, because realistically they won't need anymore.

> Are there any ARRL publications, especially the handbook, which contain
> plans for a linear amp which will run on 5-25 watts drive power?
>
>

Of course they are, though who knows if they are shown as stand alone units. After all, one has to build a linear to get low level stages up to a higher power. And given current design, they are likely to be broadband amplifiers, with external filtering.

If you don't see stand alone amplifiers, that's because there is little need. Most rigs already put out more power than the 50watts or whatever.

Yes, the ARRL Handbook for 1965 had a single-tube 811A linear.
15W peak input or so should give 150W peak output.

I've got an NC-240D with original speaker that I'm going to start working on shortly (low volume). The speaker cord has a broken/duct-taped bakelite plug on the end. When you posted this I thought "all right!!". I promptly ran in & dug out the speaker-----after checking I find the cord/plug on mine is -- 5 pin plug and a cloth covered cord. There were several variants to the NC240 if the pictures I've ran across on the net are any indication. Mine has a different dial than most that I've seen...someone needs to do justice to the National line of receiver's by gathering info and publishing a book -- like Chuck Dachis did for the Hallicrafter's. National made some very distinctive & innovative equipment in their day, and I always have problems finding definitive information on some of their offerings.
Oh well, hope the cord finds a home.

First, I would check with Simpson or one of their meter repair centers -
since Mercer and Simpson merged years ago.
http://www.simpsonelectric.com/calnr.htm

In Canada, there are 2 Simpson service centers:
http://www.simpsonelectric.com/sccan.htm

One which is ITM
http://www.itm-ins.com/ourlab/ourlab.htm

You can send it in a properly packed box to:

Simpson Electric Company
Attn: Repair Department
520 Simpson Ave.
Lac Du Flambeau, WI 54538-0099

The meter can be taken to one of our service centers.

Keep checking e-bay -- one there sold for $5 and was listed as fully
tested and operational.
Check for completed items there to see it.

Probably cheaper than a meter repair

I just got this unit at the ABQ swap and started looking for a a manual with Google and found that unit is differnt from the ones I've found pictured. It has 3 Collins mechanical filters. At the top upper left it has a Squelch control and next to it is a Noise Silencer control. The mode swtich is labeled AM and SSB/CW. The lettering looks factory done. The filters have been added on a sub chassis and I'm not sure it is a factory mod or homebrew but it has been nicely done. The S meter was made by Texas Instruments. It has some problems including lots of nosie, hetrodynes, etc.. I've only seen one of these in the past and can recall which version it was, they must be scarce? Anyone have any info?

Appears to be the Mil version of the SX-73 at any rate, also similar to the
SP600. Seems to be Hallicrafters?

Hank,

The Hallicrafters didn't come with mechanical filters. The R-274 series actually had receivers built by both Hallicrafters and Hammarlund. The Hallicrafters were designated R-274/URR, R-274D/URR and SX-73. The Hammarlund SP-600's that had the R-274 designation were listed as R-274A/URR, R-274B/URR and R-274C/URR. The full list can be seen at: http://www.hammarlund.info/sp600.html

How about a photo of what you got?

Les

Sorry, it says FRR, not URR!
Lack of thinking, sorry.
I'll put pix up at: alt.binaries.picutres.radio

Ok. Yea that would have been a rare one allright. It's either a SP-600 or a SX-73. The collins R-390, 388s etc used the URR designation and other radios but I've never heard of a R-274 under that. I'm just going on memory so I could be wrong.

Henry -

This is definitely the "Hallicrafters" SX-73 version of the R-274. I've had a couple of these pass through my hands and have one right now. But yours seems highly modified. Also, I have never seen the front panel painted with the color yours is - Does it appear original? The two additional knobs in the upper left hand corner are new - On "normal" SX-73 models, there is nothing but a channel tag there. Also, I notice one of the toggle switches is labeled, "calibrate" when on the standard SX-73, it's a switch for the Automatic Noise Blanker. Finally, I notice there is a "notch" adjustment in the middle on the lower rows of knobs - on the standard SX-73, this is a Crystal Phasing adjustment.

Yours is quite a rare find, indeed - I have never seen one like this. The scope of modifications would suggest these were not home brew modifications - if I'm wrong, whoever did it was highly motivated!

Now, would you be interested in parting with this unit :-)?

Enjoy your find!

The brochures for the 2005 CC-AWA Annual Conference
are in the mail.
If you've attended the Conference anytime since 2002
or if you're a CC-AWA member, you will receive
a brochure.
If you do not get one, just send me your mailing address
and I'll be glad to get one out to you.
You can find all the information and more on the Conference
web page at, http://cc_awa.homestead.com/Charlotte.html
Her you will find links to other pages with pre-registration
information, including how to pay your pre-reg. using PayPal,
plus links to pages full of information about the fantastic estate
auctions that will be a big part of this years Conference.

The dates for the Charlotte Conference are
March 24-25-26, 2005.
Mark your calendars now, you don't want to miss it.

73, Ron

Henry,
be extremely careful when cleaning or working around the finger contacts on
that turret assembly, if things get out of mechanical alighnment they can
get mashed pretty easily.

Good luck,
John

I have one of these and if anyone out there can tell me the freq range
of this wattmeter/SWR meter. It has a coupler inside and appears to be
removable like the Bird. The meter scale goes to 400 watts.

MC Jones model MM-706 with N-connectors

It says MicroMatch on the meter face. Also has a phone jack on the
front panel, what would that be for?

Thanks for any help

Thanks, I'll be extra careful..
I uploaded several more pix to abpr showing the mfg date, label, filters, filter subassembly and view of the chassis from below. The bottom cover plate has 27!! screws. Any other info appreciated.

FWIW: It's considered rude to post a request for an E-mail
response to a Usenet newsgroup, and then never check the group for
responses.

International Crystal in Oklahoma City can help you. See this
link:

http://www.icmfg.com/motorola.html#vhf_hi

Their part number for what you want is 167950.

Keep in mind that the radio will need at least minimal alignment
following a crystal change (the degree of such depends on how far away
the new frequency is from the radio's original one), and that you will
need the proper test gear (an RF communications analyzer, aka a service
monitor), and the radio's manual, to do that alignment.

If you lack the appropriate test gear and documentation, I can do
the recrystal and alignment for you at rates considerably lower than a
commercial shop.

Since the frequency you're referencing is a commercial one (looks
like a public safety allocation), I would also need to know what your
FCC-assigned callsign is before I could do anything.

Happy hunting.

662. Good News! -- Jesus Christ Went To The Cross So You Can Go To Heaven

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-06 19:35:35 UTC
From: Good_News_For_You_All@yahoo.com
Message-ID: <1107718535.026673.117820@o13g2000cwo.googlegroups.com>
Source record: 19501

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our past, present and future sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

Have a great day!

I wonder what will happen when the next AOL automatic draft bounces with
an "Account closed" message?

AOL was my first ISP (I didn't know any better then). When I quit AOL,
I expected to see the games that I'd heard about, like "losing your
paperwork" to get in one more bill. I was a bit surprised to get only an
email message begging me to reconsider. You obviously need to write to
them. At worst, you may need to have the estate's attorney write to them;
a registered letter on a law firm's letterhead should get bucked
up to people who are permitted to know what they're doing. Remember, the
people who answer the listed phones at mass marketers are, effectively,
idiots. They may be normal people outside the call center, but they are
operating under policies that make bots of them.

Just order them from QMX crystals. At ten bucks or so each it's probably
easier just to have new ones cut.

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our past, present and future sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

Have a great day!

DO NOT blow off the dust. If it is Cadmium, you are poisoning yourself
and your work area. Rinse it off, but don't scrub. Then use a thin clear
acrylic to seal it. Very nasty stuff. Cadmium is a much more lethal
item than asbestos.

If your interest does not include tube-type televisions,
go ahead and bite the bullet and get a nice-condition TV-7 or,
if you're rich, a TV-2. They will test nearly anything in
ham boatanchors and lots of people use them, so advice,
information and parts are available. Some may argue
that their "MojoJoJo 2000" is "better," but if only
a few people have them, it's going to be hard to get
help when trouble comes.
If you want to do televisions,
one of those folks could best advise.

p.s. If you decide to get a TV-7 or TV-2, have someone you trust
check it out first; there are a lot of them in very worn shape.
That's a testiment to how good they are, that people wear
them out, but you don't want your tube tester to be your first
restoration project.

Interesting, but wrong!

Cadmium oxide is indeed deadly stuff, but it is a dark brown powder,
not white. Read the MSDS that you quoted. It is on the first line
under "Physical Properties".

The white powder on the chassis is zinc oxide, the stuff that is in non
PABA sunblock lotions.

It almost takes an act of congress to turn cadmium plating into
cadmium oxide. Very high temperatures, and air will do it; water won't.

As a welder, I potentially come into contact with cadmium oxide anytime
I try and weld a piece of galvanized steel. When steel is prepared for
galvanizing (zinc dipping), it is first pickled (acid etched), and then
given a microscopically thin electroplating of cadmium to prevent flash
rusting. Then it is dipped in zinc, or zinc electroplated. When you heat
the metal to welding temperatures, both the zinc, and the cadmium turn
into their respective oxides. The result appears as a very light yellow
powder. Light yellow, because it is mostly bright white zinc oxide, with
a very tiny touch of brownish cadmium oxide. As fledgling welders we were
taught that zinc oxide would give you a 24 hour fever, but was harmless,
but cadmium oxide would make you dead, so avoid welding cadmium plated
steel.

Most anything in a Hickok will do nicely. I prefer the 539C (or B), but I have also used units in the 700 series (736?).

If you google Hickok, you will find a host of pages dedicated to the history, and technical issues of the Hickok testers.

Chuck- What about that yellow-green looking stuff we sometimes
see on chassis that we know were Cadmium plated?
That the bad stuff?
If so, I should probably be dead- I washed some of that powder
stuff off with my bare hands many years ago.

Hi David,

Cadmium oxide is not water soluble. It is mostly an ingestion and
inhalation hazard as I understand it.

I have seen that kind of corrosion on some items, I was never sure
just what it was. Typically it appeared on small screws and standoffs
that otherwise had a rather flat whitish/gray appearance, not shiny at
all. There are so many different treatments that were used on metals,
it would be hard to keep track of them all.

I have had numerous bits of hardware that I bought new that were sold
as being cadmium plated. It was a standard item from the 60s thru
the 80s. They are shiny, and bluish grey in color. I have never
seen them display any sign of corrosion, despite storing them for
years in a damp basement.

What are you testing? Receiving tubes, transmitting tubes? Do you need to
test weird TV tubes like compactrons?

On the whole, I would advise getting the cheapest real transconductance tester
that you can find. Stay away from mutual conductance types. But, if you need
to test something unusual (and 833s and 729s are unusual on testers but
common in ham rigs), you might want more.

I'd suggest a TV-7D, or any TV-7 for that matter.
These are very well built with higher quality parts and
will last just about forever. They will also test most tubes
you are likely to come across.

I've sold all of my other tube testers and kept a couple
of TV-7D's.

For Sale a very nice B&W 5100B transmitter. It's been sitting on my shelf for a few years now not getting any use. Am selling it to make a bit more room! Cosmetically, it's in very nice condx. The only thing wrong is a very small nick of paint missing on the right side of the front panel. Other then that, it's a "9" all the way. The last time it was plugged in, it worked just fine. I have a copy of the original manual to go with it. The selling price is $400. I'd really prefer a local pick-up as this unit weighs in close to 100lbs. I'm located in southern NJ. Tks very much, Steve K2FW

Source record: 19536
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

I'm out of room, and so I'm offering a collection of ten receivers for sale, including:

National HRO-60 with 4 coils

National NC-183

National NC-200

National NC-100 parts set

National NC-88

Hammarlund HQ-170A

Scott RBO-2 with cabinet

RME-45 & matching speaker

Drake 2B with 2BQ speaker/Q-multiplier

All of these are in decent condition, but they are unrestored, and need cleaned up and electronically restored. The grey Nationals are scratched up a bit, as is commonly found. Most of these power up, but I've not checked them further. They may be missing the occasional knob, etc.

I bought these from estate sales or hamfests with an eye towards restoring them myself, but that's not going to happen for at least the next twenty years. :)

These are available for pickup in NW Ohio; I won't ship them. I can deliver them to the Maumee, Ohio Hamfest in March, or to the Dayton Hamvention in May.

I'll sell the whole bunch for $750. Reply to radionicist@gmail.com.

Thanks!

Tony

699. TV-7 Adapter for sweep tubes

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-08 22:46:26 UTC
From: Edward Knobloch <alias@nowhere.net>
Message-ID: <6jbOd.25841$W16.22052@trndny07>
Source record: 19538

The TV-7 series military tube tester is considered excellent,
but it has a shortcoming: it is unable to test sweep tubes
which don't have an octal base.

Dan J. Nelson sold adapters for use with the TV-7.
The adapters, containing 9 pin or 12 pin compactron sockets,
are plugged in to the octal socket of the tube tester,
permitting modern TV sweep/transmitting tubes
like the 6KD6, 6LQ6 or 6HF5 to be tested.

He used octal plugs with a 9 or 12 pin compactron tube socket
wired on top as follows:

Octal Pin 9-compactron pin Octal Pin 12-compactron pin
1 1 1 1
2 2 2 2
3 3 3 3
4 4 4 4
5 5 5 5
6 6 6 10
7 8 7 11
8 9 8 12

Example:
6HF5 tube 12 to 8 adapter fil 6.3 selectors BY5-0340
bias 44 shunt N/A Range D Press 2 and hold, then 3
Min 32 New 60 top cap to plate

To perform a "Life" test, click the filament down one notch
and retest the tube. The reading should not fall off
more than 20% from the previous value.
Readings lower than this indicate a cathode which is marginal.

I don't know if Dan is still selling these, but it would be
possible to duplicate his design using a Pomona TVS-8
above-chassis octal test socket adapter.

73,
Ed Knobloch

Good News!

Do you know how simple it is to go to Heaven after this
life has ended?

The good news is that God came from Heaven to earth
in the person of Jesus Christ over 2000 years ago and
died for our past, present and future sins(misdeeds).
He was born in the land of Israel supernaturally to a
virgin Jewish woman named Mary. He lived a sinless life
for thirty-three years and then sacrificed His sinless
blood and died on a cross to pay the death penalty for
our sins.

After Jesus died He rose from the dead three days later
as He said He would. The Holy Bible also tells us that
Jesus Christ ascended into Heaven and that all who accept
Him as their Lord and Saviour will live forever with Him
in Heaven where there is no more death, sorrow, sickness
and pain.

The Holy Bible very clearly explains how simple it is
to be saved and on your way to Heaven, "For if you
confess with your mouth, "Jesus is Lord," and believe
in your heart that God raised him from the dead, you
WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if
you will open your heart to Jesus and pray the following
prayer:

Dear Jesus Christ, I want to be saved so that I can have
a home in Heaven when I die. I agree with You that I am a
sinner. I believe You love me and want to save me. I
believe that You bled and died on the cross to pay the
penalty for my sins. I believe that You rose from the dead.
Please forgive my sins and come into my heart and be my
Lord and Saviour. Thank You Lord Jesus Christ for
forgiving me and saving me through Your merciful grace.
Amen.

You are now a Christian if you said the prayer and allowed
God to save you. Welcome to the family of God.

Have a great day!

I've got two Galaxy V parts sets here. I recall I bought them on this venue years back hoping to make one whole one out of the leavings but that never happened since both suffered from a defunct output tank wafer on the bandswitch.
Neither one is really salvageable without this part but otherwise they are a good source of parts for a homebrewer or somebody that has their own pile of Galaxy V with better mix-n-match parts options :) Assorted tubes in place, no finals.
I need the space so they are free for the asking. I'm located in Puerto Rico and can only ship via USPS which might run 15-20 bucks Parcel Post each one.
Inquire to exray at coqui dot net.

Thanks,
Bill WX4A/KP4

If he really wants them to read out closer than 1 KC, he can bend (very
carefully) th plates onthe VFO tuning capacitor. You have to remove a little
circuit board or some such thing to the left of the odometer readout to get
access to it.

By benidng and twisting the plate segments, he should be able to improve it.
But honestly, this is a fine rig, and if he isn't experience in "tweaking" caps
this way, I'd say learn to live with it. 73, Mike K.

I need 2 knobs for a Galaxy GT-550 because the shiny end caps got lost. Do
you know if the knobs from the V the same?
tnx

Once I went to a friend of mine and measured the potentiometer of the I-177 after fully disconnecting it from the circuit, and wrote down a table of ohms vs. degrees. I should have that table somewhere in the shack. That potentiometer, though wire wound, is highly non linear. I guess I would need the original spare part. I tried with a normal wire wound 3,000 ohm potentiometer but readings are obviously greatly offset. I also tried out to figure out a way of emulating the non linearity putting fixed resistors in parallel and in series, but unfortunately whatever one does the obtained non-linearity goes in the opposite direction w.r.t. it should be.

Do you have a 3,000 ohm non linear potentiometer to check?

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our past, present and future sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed
God to save you. Welcome to the family of God.

If you decide to wait till later you may die before you get
another chance to be saved because none of us knows
exactly when we will die.

Have a great day!

So it's an antilog taper and not a log taper? How far off from a simple
reverse log is it?

Hi,
The pot is nonlinear and the dial scale is also, so the resulting
curve defies logic. But all Hickok bias pots have been the same,
pretty much, since the 1930s. There is -40V across the whole pot, and
-3V at a dial setting of 20 (22 for the military TV-7).

Well, no one can force you from it, but it is against Usenet convention
to post binary files to non-binary groups. There are good reasons for
it. There are binary groups set up for that purpose and it is very easy
to point to your binary file that is posted to a binary group, and any
gentleman would be more than happy to abide by that convention.

Hello, Tony

Sorry, I can't help you find that tube tester bias pot.

One thing, though:
I know the TV-7 manual gives voltmeter readings
versus bias pot settings, set up using a military DC voltmeter
of only 1K Ohm/volt sensitivity.
The available voltmeter ranges were 0 to 10V
and 0 to 50V, so the load across the bias pot
was either 10K or 50K depending on the voltage
to be measured during calibration of the bias pot.

I assume the I-177 was also intended to be calibrated
using a DC voltmeter of that sensitivity.

73,
Ed Knobloch

I am thinking that if you could use a standard antilog or log pot
(would a 5K audio taper be close enough?) you could then change the dial
scale accordingly. If you are willing to change the dial, you only have
to get reasonably close to the original taper.

Yes, folks CAN force you. Your news admin can refuse to allow service to
you (or refuse to allow binary posting), and the site downstream can refuse
to accept traffic from your site if that does not take place.

These sorts of things don't happen today except in pretty egregious cases,
which is what has driven a lot of backbone sites just to drop all binaries
to discussion groups themselves.

731. Re: Question on I-177 tube tester

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-10 18:32:42 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <eNNOd.524017$b5.24399643@news3.tin.it>
Source record: 19570

I found the table. The original potentiometer behaves as follows:

Reading on scale Ohm
10 55
20 175
30 360
40 825
50 1200
60 1700
70 2190
80 2900

The scale on the panel is LINEAR. Of course I could paste a non-linear paper scale on the panel, thus emulating the non-linear potentiometer. But if one tries to do so, he will immediately realize that an important part of the scale gets highly compressed, with difficulties in accurately setting the knob to where indicated by the book.

Thanks for the suggestion to use a standard potentiometer that approximately has the same behaviour and to paste a paper scale to compensate for the difference. However, I will have to verify two things:

- whether potentiometers having a similar behaviour can really be easily found
- how much power the original potentiometer was supposed to dissipate. It may not be easier at all to find high-power carbon potentiometers

Thanks for the info. However, for the I-177 I have seen no calibration procedure. I guess everything relies on the fact that the potentiometer has the specified response.

733. FS: Collins Mechanical Filter, Waters Reflectometer and More

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-11 00:14:52 UTC
From: David Hollander <n7rk@cox.net>
Message-ID: <420BF8FC.6000507@cox.net>
Source record: 19572

Here are a some items for sale. Prices do not include shipping. I will
ship overseas.

Collins Radio 2.8 kHz Mechanical Filter.....$125 plus shipping
Here are the numbers on the filter:526-9380-000 F455Q-7
tested in my 75A-4 and sounds great!
http://members.cox.net/radiodx3/collins_mechfilter.JPG
http://members.cox.net/radiodx3/collins_mechfilter2.JPG

Waters 369 Reflectometer.....$100 plus shipping
Clean tested and working unit with a photocopy of the manual.
It does have two small holes on each side which may have been from a
bracket mount.
http://members.cox.net/radiostuff9/waters369.jpg
http://members.cox.net/radiostuff9/waters3692.jpg
http://members.cox.net/radiostuff9/waters3693.jpg

Dow-Key Clone Coax Relay.....$25 plus shipping
28 Volt dc with BNC and Type F connectors
http://members.cox.net/radiodx3/coax_relay5.JPG

Hewlett Packard HP 331A Distortion Analyzer.....$100 plus shipping
Clean working unit. No power cord.
http://members.cox.net/radiostuff9/hp331a.JPG
http://members.cox.net/radiostuff9/hp331a2.JPG
http://members.cox.net/radiostuff9/hp331a3.JPG

Digital Precision 2440 Nixie Tube DVM.....$40 plus shipping
This unit will measure DC and AC voltage, and Resistance. This unit has
been tested and works. It does not include a power cord.
http://members.cox.net/radiostuff9/dp2440.jpg
http://members.cox.net/radiostuff9/dp24402.jpg

Batch of W.W.II Crystals.....$30 plus shipping
39 Crystals. See photo for frequencies. Here is a link to the frequency
conversion chart http://members.cox.net/n7rk/ft241_xtal_list.jpg
http://members.cox.net/radiostuff9/xtal_batch.jpg
http://members.cox.net/radiostuff9/xtal_batch2.jpg

Vintage Westinghouse Portable DC Voltmeter.....$35 plus shipping
This meter in a heavy bakelite measures 0-150 volts and the ranges are
changed by making the appropriate connections to the meter. The ranges
are: 1, 5, 15 and 150 volts. This is a working unit in nice condition.
The instruction card on the inside cover has a date of 1942.
http://members.cox.net/radiostuff9/west_meter2.jpg

Thanks for looking.

I have an old HQ140x I bought non working and after replacing the filter andvarious other caps and a couple tubes, its up and running. I realigned the RF section to good effect but I'm suspicious the BFO isn't working quite right. I've replaced the suspect looking caps in the BFO can with orange drops and it works but it's a lot trickier tuning in SSB than on my HQ129x and strong CW signals seem to overload it easily. Any ideas? Thanks.
Andy W1AWB

If the KWS-1 fan is still present, it may be salvagable
by replacing the bearings.

Here is an excellent web page by Jim Garland on the bearing
replacement:

http://www.miami.muohio.edu/president/personal/w8zr/vintage/transmitters/kws1fan.htm

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

I do not know the HW100, but for the HW101 I have using 6883s should be no problem. If you put on paper the filament circuit you will easily realize that putting the final tubes in parallel instead than in series makes no change for the other tubes.

On older receivers, I often back down the RF gain control to prevent
overload on strong signals --
when using the BFO for SSB or CW reception. For those receivers that do not
have an RF Gain control, I use external attenuation.

I have the schematic of the HW-101, which succeeded the HW-100 but is basically the same. The 6146 heaters are in series, so with a little rewiring, 6883s can be used.

But be sure to mark the rig to show that this mod has been done, because if at some future time someone puts 6146s in, they'll be toasted.

Very true.....with those old receivers that didn't have one of the new types of product detectors, you had to run the unit with AGC off and use back the RF gain down to eliminate the distortion. Newer receivers use a mixer as an SSB detector.....the LO injection on these types of detectors is run at about 10 times the expected level into the RF port. This minimizes the distortion and allows the AGC to be run on these types of signals.

Source record: 19590

What I'm saying is there was something wrong in the BFO section. I KNOW to back the RF gain down. Did you read my original post? Sorry if I wasn't clear enough. Compared to my HQ 129x, a very similair radio, the SSB was much trickier to tune in and CW signals were overloading much quicker. Something was clearly wrong. Some people have e-mailed me off list with ideas to increase the BFO injection slightly and everything is working fine now. Thanks to all who helped.

-Bill"

We all start out in radio knowing nothing. What we end up with is what we learn from others, or figure out for ourselves.

I suppose I learned about different types of detectors and bfo injection about 45 years ago - but I did not know it when I started. It still had to be learned. And one thing I learned in graduate school was that usually the person asking the most questions was the smartest.

It disappeared when it became unneeded knowledge for most, ie when product detectors came along and those using old receivers for SSB were in the minority.

The best source of old knowledge is when something is new, because nobody assumes everyone knows, and it's information people want. So the magazine articles covered this really well when SSB first really hit in the late forties, with complete and detailed articles, and then as SSB became more common it was still out there but reduced to a paragraph or a sentence. Since nothing has changed much, those early articles are still as useful as back then.

WIth some things, say superregenerative receivers, it's like that game, "broken telephone". By the time you get to the end, articles are not repeating what was originally said, but what's been watered down in decades of rather simple articles.

Of course, the original poster has said there was a problem beyond this matter, and indeed there was something in the wording that made me think it wasn't this issue.

As 6146's became expensive hams started using 6883's which were cheaper
but now the 6883's cost as much as the 6146's. If you are not using
the rig mobile and can fit a 1:2 or 1:4 step up transformer under
the chassis you can also find 6159's a little cheaper. These are
the same as 6146's but with 25 volt heaters. The 6159 was mostly
used in aircraft radios and is available military surplus.

Ok, sorry, I got the impression from one post that turning the gain
down was supposedly a "fix".

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our past, present and future sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed
God to save you. Welcome to the family of God.

If you decide to wait till later you may die before you get
another chance to be saved because none of us knows
exactly when we will die.

Have a great day!

G3TQD modified his HW100 so we could operate RSGB national field day
within the rules, and put a PL36 into the PA instead of 2x 6146B's.
Operated the whole contest with at least 120W input with no problems,
so I would believe it is many alternatives which are not exact
equivalents but will work fine

Hello out there! I still have two original HRO-600 manuals left. They are both mint, & come with the schematics. $20.00 each. Additionally, i still have original/mint/with schematics, HRO-500 manuals...same price. I had placed an ad on Boatanchor news a couple of months ago, & due to a computer problem, lost some days worth of e-mails. I don't know if there was an interested buyer back then, & if there was...and i didn't respond...it was due to this computer (virus) problem.I would apologize to whomever may have responded back then. I DO answer ALL e-mails.Thank you!

From: nospam_deepsea_77@yahoo.com
Message-ID: <420fa6c2.888951@news1.news.adelphia.net>
Source record: 19458

Anyone out there got a spare front panel IF Gain Pot for the RX-1?
This little *&%$ is VERY non-standard, having a threaded section
that's almost 5/8" long, so it will fit through that very thick set of
two front panels.

Part Number is B-10-70; it's a 10K linear pot (easy enough, I have
three standard ones!) but that long threaded shaft really threw a
wrench into things.

Picture at: www.moonlightsys.com/misc/rx1_IF_gain_pot.jpg

Already adapted one of my junkbox pots with parts from the B-10-70
pot, but the result is not working very well; the process of
machining, cutting and adapting the various parts is kinda rough on
potentiometers.

Would also consider (as a last resort) buying an entire RX-1 junker
chassis.

Thanks,

Lin/KJ6EF

Easy answer. Radio-Mart is the seller (Martyn in Louisville) and he now has
all sales with private IDs.
Unfortunately, unless constantly watched by eBay private IDs can encourage
the seller (or associates of seller)
to bid on the item and raise the overall prices (This practice is illegal on
eBay - when they catch it).

Radio-Mart disappeared from eBay for a while -- unknown whether eBay
initiated this censorship --
Go to Safe Harbor on eBay with that question.

Do a Google search on this name and eBay --- you will find hundreds of
comments from buyers throughout the Internet newsgroups, etc. -- make you
own judgments from what you read.

I know a lot about Martyn. He screwed me on a SX-28 cabinet. I just was
amazed at the price. Someone had to bid. He didn't bid his own item that
high or is he that stupid? At that price, Ebay gets a good amount of money
that comes out of his pocket.

Who made the pot? If you can find another of the same brand you can
usually pry the tabs up and replace the resistive element and use the
exoisting shaft, body nad cover to keep the original look.

Try the R-390 list; you'll have to subscribe to post, but the list is
full of good advice from people who know the rigs.

You can put a 47 Ohm 10% resistor in to replace the 3TF7 and probably
never have any filament regulation problems at all. It was put in
the circuit for situations where the 110 VAC power supply was *very*
uncertain.

The R-390 list is hosted at qth.net, and there's a signup page in the
tree based at <http://www.qth.net/>.

Replacements for 3TF7 are a FAQ, and you'll find leads if you really
want to spend the money. Just ask.

You need regulation for SSB-CW RX

799. Trade: Icom IC-703 + PS for National NCX-5 setup

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-15 03:23:18 UTC
From: W4UDX <w4udx@bellsouth.net>
Message-ID: <6UdQd.1514$3b7.502@bignews3.bellsouth.net>
Source record: 19488

Want to do even trade: excellent (probably mint) Icom IC-703 QRP HF transceiver and mint Pyramid PS-4KX power supply for National NCX-5 MK II with matching external VFO and power supply / speaker. The National gear must be in excellent condition and working correctly on all bands and modes and include manuals (copies OK, CD's OK).
My Icom IC-703 includes the original box, manual, mic, DC cable. The power supply icludes the original box and manual and is just perfect to power the radio. This 703 has just come back from Icom service for updates and 60M mod. A bad solder joint was also repaired by them. It is working perfectly and has a ton of features. I bought it to use mobile but never did. Less than an hour of transmit time is on it. Bought in Oct of 04.

800. FS/FT: Drake TR4C, Two T4XC's

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-15 03:24:32 UTC
From: Jeff Camp <jcamp2@cox.net>
Message-ID: <NXdQd.9029$ds.160@okepread07>
Source record: 19489

I have for sale a Drake TR4C and original manual in good condition. Cabinet has some small scratches on it, but no deep gouges. I used this radio daily until about 6 months ago. I would rate it about an 8 cosmetically, 9.5 electrically. Asking $350 plus shipping.

I also have a pair of Drake T4XC transmitters, one working, one not. The working one is about an 8 cosmetically and a 9+ electrically. The non-working one is excellent cosmetically, at least a 9.5 or better. The previous owner claimed it worked perfectly, but it smoked when I hooked it up and I never tried to fix it. The working one has had the microphone jack replaced with a standard 1/4" jack instead of the hard to find Drake jack. Asking $375 plus shipping for the pair.

Would also consider a trade for a Swan Mk II amplifier, Amp Supply LK-450 or 500, a nice SB-220, or a legal limit antenna tuner - Palstar AT1500CV/AT4K, Ten Tec 238, or Nye Viking MB-VA (sorry, no MFJ please).

Please reply via email to jcamp2@cox.net.

Thanks and 73,
Jeff N0WJP

I have a Vintage 60's Galaxy V Mark 2 HF rig that covers 10 to 80 meters. This is a tube transceiver and you must dip the plate and peak the load. The front face is excellent and the cabinet is in very good condition. It comes with the optional VOX 35 C board and the crystal calibrator model 35. I have the original manual for the rig, crystal calibrator and vox unit and also comes with a Turner S20X hand microphone. Its in working condition and also have the original Galaxy V Mark 2 brochure and comes with its seperate power supply....If you need any pictures I can send you some digital shots.....I will take $175 plus shipping.....I can be reached at (508) 821-2993 or email......WZ1U Steve / Lakeville, Ma.

I was issued this Simpson 206 Series 2 as a field engineer for Western Electric Company. It's in good condition--all bakelite case and housing . Have the leads, schematic, parts list and user manual.I just got through checking the meter out as it has been around here for more than 50 years and replaced all the batteries, the oxide rectifier and several resistors all for the ACV measurements. Ohms scales , DCV scales, and ACV scales all work fine now. Meter is very clean--no chips or cracks etc. This was the second Simpson 260 made (Series 1 was the 1st). I have copies of the schematic, parts list, and User's manual from the initial issue of this meter. Very scarce and a collectors specimen or great to use in any radio shack. Best offer over $75.00 will sell. If interested or want more info etc., let me know.

Well here we go again. Some things are new and some of them are listed again because some folks didn't send $s or contact me. Oh well I don't mind if someone changes their mind, but please guys let me know because if I tell someone it's spoken for and you don't let me know, well you know. Anyway here gos

No prices are etched in stone so make an offer. I need to get rid of this stuff because I'm buying another house and my back is killing me :)
Prices do not include shipping.
I take PayPal also. (It saves me a long trip to the bank)
I can email pics if needed. Thanks for your intrest.

P.S. I' ll may be parting out an SP-600 JX-17 so let me Know your needs. It's restorable but in parts. I was in the process of restoring it but found another in great shape so it sets in a box. It's a 1953 model with the dreaded black beauties. :(

73 and good DXing.

(Hide the $100 to reply!)

MISC EQUIPMENT:
1. Antique Sensory Lightning Arrester, NOS Excellent shape. $12
http://webpages.charter.net/brianhill/arrest.jpg

2. Vintage Olson PH-10 Headphones, Made in Japan, They look like 50s vintage with leather on headstrap. Very good condition. $10
http://webpages.charter.net/brianhill/olsen.jpg

3. Toshiba Satellite Pro 490XCDT Pentium II 266MHz 13.3" TFT Display 64MB of RAM CD-ROM Drive 4GB Hard Drive. Externall floppy drive. Docking station incuded.
Works great. I can't get the modem to work now? $120

4. 1935 Tobe Deutschmann Browning 35 Receiver (I knocked of a $100 from my first post and it didn't sell on ebay either) Maybe I'm stuck with it? LOL :)

This is very nice restored Browning 35. It works good. All the capacitors were changed. This is the rarer version with the tuning eye. These radios were a kit and came with the preassembled Tobe tuner for ease of assembly. The 35 was a affordable alternative to the more expensive preassembled sets

like the Hallicrafters Super Skyrider, RME 9 etc... These radios didn't come with a cabinet to keep cost down and this one was modified for it from a small console and It looks real neat. This is a very rare and unique radio. The chassis is very shiny and clean with no corrosion. P.S. THIS RADIO CABINET IS A VERYSMALL CONSOLE CABINET (36" H, 22" W, 11 1/2" D) AND WEIGHS ONLY ABOUT 20-25lbs AND THE RADIO IS ABOUT THE SAME. SO THE TOTOL SHIPPING WEIGHT SHOULD BE LESS THAN 60lbs $400

818. Need HQ-129-X Bandswitch help - Hammarlund

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-16 17:49:11 UTC
From: BBIRD97082@aol.com
Message-ID: <1108576151.549188.155410@c13g2000cwb.googlegroups.com>
Source record: 19407

I've spent quite a bit of time trying to get the 5.7 - 10 MHz band to come back to life on my Hammarlund HQ-129-X. I've got the user manual which includes a schematic. When I got the receiver several months ago I needed to "wiggle" the bandswitch knob to get this band to work. The band then worked fine, especially my frequency of interest around 7.040 for cw. All the other bands worked without any "wiggling" of the bandswitch knob.

Now after not being used for about 60 days no amount of "wiggling" will get the 5.7 - 10 MHz band to come alive. It is as if the antenna is disconnected. All the other bands work fine.

I've been taking a close look at S2 which is connected to the bandswitch knob. S2 actually has six rotary switches, each with front and rear contacts. I thought some spraying with contact cleaner, or light swabbing with contact cleaner with q-tips would bring the band back. I have had no success. All the other bands still work fine, but not the 5.7 - 10 MHz band which is the one I want to use.

Any thoughts on what steps I could take next.

Thanks,

Bill Bird

Try a good cleaner like Caig Pro gold or DeOxit. It may be a bad solder
joint too. Try touching up those connections with your soldering iron. I
some times use a nonconductive stick to lightly move the wafers and look for
intermittents, but don't damage the contacts, just lightly touch each one so
it contacts the moving conductor. Good luck

I have for sale as a complete station or will sell each piece individually a Galaxy V Mark 2 station. It covers 80 to 10 meters and comes with the original manuals for all the pieces. The transceiver will come with the optional crystal calibrator and vox board, also a Turner hand microphone and the external power supply for $175.....Galaxy station console $95, Galaxy VFO $95, 300 Hz external cw filter $50, Galaxy 2000 amplifier 2KW PEP will not load up tubes are ok will need some work and comes with the power supply $150......The station is an 8 out of 10 and its in very good condition. I have plenty of digital shots I can send you if needed. This is a Vintage 60's HF station and rare to find one with all the accessories. If you would like to purchase the whole complete station I will take $450 plus shipping using FEDEX ground......If you would like more info on it email me or I can call you if you like.....WZ1U Steve / Lakeville, Ma.

823. FS: Hammarlund BC-779

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-16 23:22:25 UTC
From: JRS <n3ab@fast.net>
Message-ID: <4al711h4a23engl4nmd0mg30pk50ksnloq@4ax.com>
Source record: 19412

I have a Hammarlund BC-779B receiver with power supply for sale. Unit is a rack-mounted model and appears to be complete. I know nothing about these radios. Don't know if it works, and I don't have a manual. Included is what appears to be the power supply for it (marked as a RA-84 Power Supply Unit on the front panel). I have pictures of the radio posted at:

http://www.users.fast.net/~n3ab/bc779t.jpg
http://www.users.fast.net/~n3ab/bc779f.jpg
http://www.users.fast.net/~n3ab/bc779b.jpg

Asking $175.00 for the pair. These two items are heavy...No shipping! Items can be picked up or I can meet within 50 miles of my home (near Allentown, PA).

Thanks for reading!

John N3AB

Message-ID: <2RSQd.2161$IU.181@newsread3.news.pas.earthlink.net>
Source record: 19414

It is helpful to determine which stage is causing the problem. It will be either the mixer, the oscillator or the rf amplifier. Some stages use 2 decks. See if you can hear the oscillator in another receiver. It is 455 kHz away from the tuned frequency, and you can hear it on a nearby receiver.

It could be a component so do not tear apart the bandswitch without confirming that is really the problem. More than once I have spent time servicing the wrong problem because I did not do a good job of diagnosis.

Fortunately, the penalty occasional incompetence is less than if the surgeon removes the wrong part.

A signal generator can be used, too. Inject a signal (through a cap) into the mixer, to replace a missing oscillator signal (remember 455 kHz away). If no improvement, try injecting a signal into the mixer at the grid.

A little square wave oscillator with harmonics all over the place can give you a quick diagnosis by putting it on the various grids of the mixer.

After enough projects like this, you will be answering questions, too.

I finally rescued a radio I had in High School. It was a gift from some Ham whose name I have forgotten. It has spent decades in an Arizona attic so I assume some work will have to be done before firing it up. I've followed the discussions on recapping and such so no need to warn me about that. This will be my first project so I'm not holding myself out as any expert. It looks a little like some model of RME but I've not found any pictures online.

Anyway, does anyone recognize it?

Pictures here: http://members.cox.net/seaplan

Looks like an AR-77 by RCA. A pre WWII model ham receiver. Pretty
good one too. Replaced by the AR-88 just in time for the war when most
of them went overseas to England and Russia.
Somewhat rare now so cleaned up it will make a very nice addition to
any shack.
I like mine. 73 Gary de N9ZSV

It is not any of the production RME's. The only 2 window was the 69- and
from the layout, this is not it.
What are the controls labeled?

And he claims it now operates well over Collins book specs. Anyone
really think he has a clue as to what the book specs are on the set?
Anyone think he has measured the s/n ratio and stage gain of each stage
using calibrated test equipment?
Just more of his usual hype. The guy does offer some pretty good gear,
why he has to give all this fluffed up hype is beyond me, he would do
just a good, and would have maintained a better reputation if he would
just tell the truth.

> Anyway, does anyone recognize it?

Definitely an AR-77. I seriously doubt
that it came in that color, though ;-)

Nice find!

Source record: 19428

Thanks for the suggestions. I've definitely discovered something. The 5.7 - 10MHz band on the rcvr is pretty much fine from 7.35 to 10.0MHz. I've been using my Heathkit SG-8 Signal Generator. Signal strength is strong and calibration is good at 7.35MHz (bandspread set to high end, #200 per manual). At the main tuning setting of 10.0MHz the frequency is actually 9.940 (bandspread still at #200 per manual) and signal strength is still strong. Both a modulated AM tone and the CW work fine from 7.35 to 10MHz.

I purchased and used some DeoxIT but restrained myself from disassembling the S2 switch assembly.

What I've discovered is that below 7.35MHz the signal strength drops off DRAMATICALLY - so much so I had missed the signal from my generator all together until I really listened. At 7.35MHz all is fine but by the time I tune down to 7.30MHz reception has dropped WAY off. It stays that way to the bottom of the 5.7 to 10MHz band.

Since the 40m ham band is in the area where my HQ-129-X is way down in reception it is not usuable. I do believe that several months ago I was able to receive well on the 40m band after "wiggling" the bandswitch knob. That is a note I had written to myself for operating hints. "Wiggling " doesn't do anything now.

Any additional ideas are welcome. I have not done all the tests suggested but maybe this new information can help zero in on the problem. I am going to be reading about the "realignment procedure" in the manual for now.

Note: I am using my R1000 rcvr to determine what frequency my generator is producing!

Thanks for any additional ideas and 73.

Hi Bill:

This is where radio diagnosis becomes as good as an old Sherlock Holmes mystery - even better because only you will write the conclusion.

Using logic (sometimes the weak link of radio repair), it is not likely (but possible) that that the bandswitch works at the high end and fails at the low end.

However, I must say that many of the broken receivers that end up on my desk have been realigned to the point that that has become their problem. Realignment of something like the HQ-129X is pretty basic and easy to do with a calibrated signal generator, but sometimes that may not be the problem.

Aging is not likely to change realignment substantially, rather it is incremental. So, the cause is likely to be something else.

The oscillator stage is working and injecting a signal into the mixer - but the level could be decreasing as you get lower in frequency. Use your R1000 as a signal level measurement system and determine whether the signal leve at the mixer grid is less at the low end than the high end. Likewise, use a probe (small wire loop at end of small coax cable near the point to be tested) on your R1000 to determine whether the signal level through the front end and mixer input tuning changes with frequency (using SG-8). If so, then try rf stage alone.

An ineffective bypass cap on the downhill side of the tuned circuit or one on the input downhill side can cause the coil to be ineffective - more at the lower frequency end, so look there. Maybe there is something switched in on that circuit only.

You can also check each tuned circuit before aligning by clipping on a 10 pf or so cap to the open connection on the top of the variable to ground. If the signal decreases, increased capacitance or inductance at the frequency will not help. Likewise, you can use a brass slug attached to a wand and insert into appropriate coil to see if less inductance or capacitance will help at that frequency. If both decrease signals, then realignment is not needed.

Finally, if nothing works, go out and have a cheap beer wait until tomorrow. After enough of this, you will wake up in the middle of the night and know what the answer is.

After years of doing this (and being successful), you can write adetective book on radio mystery solutions and sell both copies on eBay for $15.

73, Colin K7FM

For what it's worth, being my radio, I'm voting "AR 77".
After getting the lead here I was able to find an online schematic
and manual for the Canadian military version (GR 10).

In my example the shield for the tuning capacitors is missing,
the socket for the rectifier tube has been replaced.

As best I can tell from the pictures I've seen so far there is a shutter
over the tuning dials that I'm also missing. Vulcan, you own one, is
there a shutter mechanism?

Lastly, anybody have any leads for the missing parts, or a full manual?

Regards,

Bob

Sometimes the brand is stamped in the metal near the mounting bushing in a very small font. I have a few new heathkit pots somewhere. I will try to find them to see if I can identify the OEM.

Can you post a clear image of the part on the news:alt.binary.pictures.radio newsgroup? A flatbed scanner will do a decent scan of most parts, but it helps to put a couple layers of a white tee shirt on top to get a light colored background.

MAKE MONEY FAST WITH ONLY $6.00. THIS REALLY WORKS !

Make from $20,000 to $50,000 in as little as 4 -6
weeks with only an initial investment of $6,by using a
simple secure internet account called Paypal, that
takes only a few minutes to join and get started.

Sign up for a FREE paypal account by clicking on the
link below: (or put it into your browser)

https://www.paypal.com/us/mrb/pal=DDKNDKMUP6RHC

I¹ve actually taken the 10 minutes it requires to join
this wacky bunch of optimists and I¹m hoping that
there are others out there that will spare the change
to try this.

READ ON : I found this on a bulletin board and decided
to try it. "A little while back, I was browsing
through news groups and came across an article similar
to this that said you could make thousands of dollars
within weeks with only an initial investment of $6.00!

So I thought, "Yeah right, this must be a scam", but
like most of us, I was curious, so I kept reading.
Anyway, it said that you send only $1.00 to each of
the 6 email addresses stated in this article.

You then place your name and address at the bottom of
the list at the #6th position and email it to your
friends as well as post this message (with your email
address in the list) to at least 200 newsgroups.

(There are thousands) No catch, that was it. So after
thinking it over, and talking to a few people first, I
thought about trying it.

I figured "what have I got to lose except $6.00,
right?" So I invested the measly $6.00. Well GUESS
WHAT!!

Within days, I started getting money coming into my
Pay Pal account! I was shocked! I figured it would end
soon, but the money just kept coming in.

In my first week, I made about $25.00 which means that
25 people joined the group after they saw my posted
messages.

By the end of the second week I had made a total of over $1000.00! In the third week I had over $10,000.00 and it¹s still growing.

This is now my fourth week and I have made a total of just over $42,000.00 and it¹s still coming in rapidly. It¹s certainly worth $6.00, and the few minutes it took to join Paypal.

I have spent more than that on the lottery!

Let me tell you how this works and most importantly, why it works. Also, make sure you print a copy of this article NOW, so you can get the information off of it, as you need it.

I promise you that if you follow the directions EXACTLY, that you will start making more money than you thought possible by doing something so easy!

SUGGESTION:

Read this entire message carefully! (Print it out or download it.)

Follow the simple directions and watch the money come in! It¹s that easy. It¹s legal. And, your investment is only $6.00.

IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk-it really works! If all of the following instructions are adhered to, you will receive extraordinary dividends.

AGAIN, PLEASE NOTE: Follow these directions EXACTLY, and $20,000 or more can be yours in 4 to 6 weeks. This program remains successful because of the honesty and integrity of the participants.

Please continue its success by carefully adhering to the instructions. In this business your product is not solid and tangible,it¹s a service. You are in the business of developing Mailing Lists.

Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list.

Here are the 4 easy steps to success:

STEP 1:

Take a few minutes to join Paypal:

https://www.paypal.com/us/mrb/pal=DDKNDKMUP6RHC

The Internet's most trusted Internet banking system for your future income. When creating your Paypal account make sure you use the same Email address as your user name in the list below so people can send money to your account.

STEP 2

Once you have a Paypal account running, use Paypal to post $1 to EACH of the 6 Email Addresses below because you pay people with an email address in Paypal.

To do this you may need to use a credit card, which is very easy, and secure so nobody but Paypal may see it. If you don¹t have a credit card show this great lucrative offer to someone that has one and get them to help you pay the$6.

What you are doing is creating a service. This is absolutely legal! You are requesting a legitimate service and you are paying for it!

Like most of us I was a little skeptical and a little worried about the legal aspects of it all. But I looked around and did some homework and found it was perfectly legal.

Here are the 6 individual Email addresses that you have to send $1 to through Paypal for this to work properly and for you to receive money.

(If you don't send the money and decide to post the message with your name in it anyway, Paypal will instantly pick this up and terminate your account,immediately,besides the other penalties!!

If you did this you could get into serious trouble because it is fraud. (So follow the instructions and post the $6 and you will make lots of money with no hassles.)

Now send $1 to each of these following email - addresses through your paypal account: (Just in case you still haven't one yet, use this link to open one in your name,

https://www.paypal.com/us/mrb/pal=DDKNDKMUP6RHC

and pay$1 to each the following 6 email- addrsses

1.) michaelance22@yahoo.com

2.) mista_chuchu@hotmail.com

3.) e.f.heckmann@web.de

4.) deejonz05@yahoo.com

5.) luciousmorgan@comcast.net

6.) darr_dude@hotmail.com

STEP 3

Now take the #1 Email Address off the list that you see above, move the other Email Addresses up (6 becomes 5, 5 becomes 4, etc.) and add Your Email Address as number 6 on the list.

STEP 4

Change anything you need to,but try to keep this article as close to the original as possible.

Now, post your amended article to at least 200 newsgroups (there are thousands of groups).

And email your message to as many people you can But remember, the more you post and email the more money you make! This is perfectly legal!

If you have any doubts, refer to Title 18 Sec. 1302 & 1241 of the Postal Lottery laws.

Keep a copy of these steps for yourself and, whenever you need money, you can use it again and again.

PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions.

You are simply paying into a money making chain of participants and if the chain is broken you are screwing someone else out of their fair share.

So, as each person who joins the family and the directions are followed, six members will be reimbursed for their participation as a List Developer with one dollar each.

You then insert your Email Address into the list and it will move up geometrically. So that when your name reaches the #1 position you will have potentially received thousands of dollars into your account!!!

What an opportunity for only a total of $6.00 !! $1 for each of the first six people listed above

To begin with, please send you're joining fee now and then add your own Email Address to the list and you¹re

in business!

HOW TO POST TO NEWS GROUPS?

Use Netscape or Internet Explorer and try searching for various newsgroups(on-line forums, message boards, chat sites, discussions.)

Log on any search engine like yahoo.com,google.com,altavista.com, excite.com, etc., then search with the subject ''millionaire message board'' or''money making message board'' or ''employment message board''or ''money making discussions'' or ''money making forum'' or ''business message board'' etc.

You will find thousands & thousands of message boards. Click on them one by one and you will find the option 'post a new message'. Then Post this article as a 'new message' by highlighting the text of this letter and selecting copy then paste from the edit menu.

Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button.

You're done with your first one! It only takes about 60 seconds to complete postings on message boards after you catch on.

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!!

BUT YOU HAVE TO POST A MINIMUM OF 200!That is it You will begin receiving money in your account from around the world within days!

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part out of 200 postings: Say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter.

Each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at # 5 and only 5 persons respond to each of the original 5, this is an additional $25.00 for me.

Now those 24 each make 200 minimum posts with my name at #4 and only 5 replies each. This brings in an additional $125.00. Those 125 persons turn around and post the MINIMUM 200 with my name at #3 and receive 5 replies each, I will make an additional $625.00.

Ok, now here is the FUN part, each of those 625 people post a MINIMUM of 200 letters with my name at #2 and they receive 5 replies each.

That just made me $3,125.00!!!

Those 3125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 react, I will receive an additional $15,625.00!! With an investment of only $6.00!!

A - M - A - Z - I - N - G - !!

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to Email Addresses using Paypal on the list, putting your name at number 6 again. And start posting again.

The thing to remember is that thousands of people all over the world are joining the Internet and reading these articles everyday.

JUST LIKE YOU ARE NOW!! So, can you afford $6.00 to see if it really works?? I think so!

People have said, "what if the plan is played out and no one sends you the money? So what!

What are the chances of that happenin when there are tons of new honest users and new honest people who are joining the internet & newsgroups everyday and are willing to give it a try ??

Anyway, it is only $6.00 for a chance at thousands. Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet.

Remember, play FAIRLY and HONESTLY and this will really work.

There's no use tryin to cheat for only $6.00 ***

Pls. use only opt-in resources for this material it will work for you and it works much faster without soliciting or spamming and higher responses*** !!!

With warm wishes, bless you and your loved ones,

https://www.paypal.com/us/mrb/pal=DDKNDKMUP6RHC

I's definitely not an RME. I have an RME 69 and an RME 70.It's an RCA
AR-77 or AR-88

I think "Fred" would be a good name for the radio in question.

Note: as others have commented, it looks like an AR-77 to me.

I am rebuilding a Heathkit Ho-10 and I'm looking for the high voltage
filter caps. They originals were 0.15 mfd at 1600 volts.
If the transformer really puts out 1200 VAC then I believe the caps
should have been rated at 2KV. I can not find any rated at 0.15 at 1600
or higher voltage. Does any one know of a source.

Putting lower voltage rated caps in series to achieve the required cap.
worries me because the adding voltage equalization resistors across the
caps would increase the current pulled from the marginally rated power
transformer.

My parts unit has an open primary from too much current draw.

Thanks

Jim

Current Mouser catalog shows CDE Polypro film caps .15uf @ 1600v or .2uf @2000v. Check Mouser.com/cde catalog page 531. Not bad prices either. You can thank switching power supplies for generating the need for HV rated caps.

Here's a new one on me. I have been exchanging email with an SX-42 owner who found my SX-42 page (http://antiqueradio.org/halli07.htm). He is missing the cabinet. He also is a sheetmetal worker and would like to manufacture a new cabinet for his 42 from scratch.

I took a bunch of measurements and photos of my cabinet and sent them along to him. This is the kind of project I never could attempt! We'll see what transpires. If he's succesful, I might just lend him my spare SX-28 cabinet to see what he could do. There are lots of SX-28s and SX-42s out there without raincoats :-)

Regards,

Phil Nelson

Were these originally paper or oil caps?

I think that Electronic Concepts in NJ still makes film capacitors with
voltage ratings this high, but they won't be cheap. And .15 is a little
bit too high for a ceramic (and you can get plenty of ceramics at that
voltage).

It's an easy proposition if your a metal worker like myself. It's just a
matter of having the tools on hand to do the job as well as time to do it
right.

eq. resistors are mostly for "leaky" caps like electrolytics. Mylar,
polypropes or ceramic won't exhibit much of a leakage at all.

I have made filters for high frequency switching power supplies out of
series ceramics with no eq. resistors.

Also made a few voltage multipliers for oscopes that lost the HV xfmer
winding. I used mylar in series, worked for years. No eq. res. there
either.

I am a big fan of eq. resistors in electrolytic applications. I would say
for this application don't worry about eq resistors.

I'm looking for some vintage water transfer decals
from Tekni-Cals. They made sets specifically for
amateur radio constructors with labels for xmtrs,
rcvrs, etc. I need them in WHITE. I have black
but they don't work well on black radio panels!
I'd also like advice on what to use in place of
their setting solution. Will the stuff that the
model train guys use work with those old vintage
labels?

Hi Dean,
You can make your own water slip decals by purchasing media from a number of WEB stores- try Google search under water slip decals. In your case you will need to find someone with an ALPS printer to do white.

For Sale: B&W 5100B transmitter. Cosmetically, it has a lot of small dings & scratches & is in my estimate, on a scale from 1-10 about a seven. However, it works perfectly. It has full output on all bands with fairly new tubes in it. The modulator has been modified by me & sounds great! If for some reason, you're not happy with it, return it to me for a full refund! It also comes with the "Original" manual, not a copy! Am asking only $200 for it. Because of the weight of this transmitter, I would prefer a local pickup. I live in the Southern NJ area. I can email other pictures upon request to anyone needing them.

I was in a radio station equipment room many years ago and they had a
SX42 in a rack.
It was used to check the signal for harmonic content.

So I would guess that many radio stations had rack mount receivers for
that use.

883. *post 101* >> GOOD NEWS! - Over 2000 years ago Jesus Christ suffered and died on a cross and rose from the dead so that we can be forgiven of our sins(misdeeds) and have a home in Heaven when this life has ended. Most people just don't know how to ask Jesus Christ into their hearts. Heres how...

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-19 23:39:45 UTC
From: RL_Grossi_2005@sbcglobal.net
Message-ID: <1108856385.348794.253380@z14g2000cwz.googlegroups.com>
Source record: 19372

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our past, present and future sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

If you decide to wait till later you may die before you get another chance to be saved because none of us knows exactly when we will die.

This means that if we die without trusting in Jesus Christ as our Lord and Saviour we will be forever separated from the love of God in a place called Hell. This place called Hell is a place of eternal torment, suffering, pain and agony for all those who reject Jesus Christ.

Choose Jesus Christ today and you will have peace in your life now and forever.

Have a great day!

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5753295644
Auction ends Feb 26, 13:45 PST.

The Harris RF-5020 is an HF Receiver-Exciter covering 1.6 to 30mHz in 10Hz steps when operating from the front panel. 1Hz tuning steps are available through the serial control interface. Power input is 26.4 VDC nominal @ 3amps max. Power out is 100 milliwatts nominal across the range, suitable for driving a wide range of military RF amplifiers, including the matching Harris units, the Redifon GA-481 (which I use), the AM-3007/URT (part of the URC-35), the AM-3349/GRC-106, and the Technical Materiel Corp GPT-1K and PAL-350 to name a few.

This radio has a digital I.F., with DSP processing employed during both receive and transmit. Available modes and selectable bandwidths associated with each mode are:

USB/LSB -- 1.5, 2.0, 2.4, 2.7, 3.0kHz
AME -- 3.0, 4.0, 5.0, 6.0kHz
CW -- 350Hz, 680Hz, 1.0kHz, 1.5kHz
Modem and Digital Voice -- 3.0kHz

The BFO function is variable +/- 4kHz in 10Hz steps from the front panel or in 1Hz steps through the serial interface.

AGC attack/hang/decay data is as follows for settings other than "OFF":

FAST - 25msec/100msec/100msec
MEDIUM - 25msec/500msec/750msec
SLOW - 25msec/1500msec/1500msec
DATA - 25ms/0msec/16msec

This unit has the following options installed:

RF-5110MD High-Speed Data Modem. In the high-rate 39-tone mode, a channel transmission rate of 3466bps is achieved by time differential phase shift keying (TDPSK) of 39 tones which is combined with forward error correcting to produce data rates ranging from 75 to 2400bps. The modem is used during digital voice operation.

RF-5120AFC Harris ALE Automatic Link Establishment. Please note this is the Harris proprietary "Autolink" ALE system. It will work with other systems containing the same option but not with the MIL-STD-188-141 ALE most often encountered

on the ham bands. The solution in that case is to set up
PC-ALE on your PC. :-)

RF-5130LPC Digitized Voice. Uses the U.S. DoD LPC-10E (Version
52) 2400bps algorithm.

More info in the auction description.

Thanks,
Mark

Good News!

Do you know how simple it is to go to Heaven after this life has ended?

The good news is that God came from Heaven to earth in the person of Jesus Christ over 2000 years ago and died for our past, present and future sins(misdeeds). He was born in the land of Israel supernaturally to a virgin Jewish woman named Mary. He lived a sinless life for thirty-three years and then sacrificed His sinless blood and died on a cross to pay the death penalty for our sins.

After Jesus died He rose from the dead three days later as He said He would. The Holy Bible also tells us that Jesus Christ ascended into Heaven and that all who accept Him as their Lord and Saviour will live forever with Him in Heaven where there is no more death, sorrow, sickness and pain.

The Holy Bible very clearly explains how simple it is to be saved and on your way to Heaven, "For if you confess with your mouth, "Jesus is Lord," and believe in your heart that God raised him from the dead, you WILL BE SAVED." (Romans 10:9)

You can be saved right now and on your way to Heaven if you will open your heart to Jesus and pray the following prayer:

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven when I die. I agree with You that I am a sinner. I believe You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins. I believe that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thank You Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

You are now a Christian if you said the prayer and allowed God to save you. Welcome to the family of God.

If you decide to wait till later you may die before you get another chance to be saved because none of us knows exactly when we will die.

This means that if we die without trusting in Jesus Christ as our Lord and Saviour we will be forever separated from the love of God in a place called Hell. This place called Hell is a place of eternal torment, suffering, pain and agony for all those who reject Jesus Christ.

Choose Jesus Christ today and you will have peace in your life now and forever.

Have a great day!

890. FS/FT: Heathkit SB-303 Receiver - excellent cond.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-20 15:13:35 UTC

I have for sale or trade a Heathkit SB-303 receiver in excellent condition. The face and case are about as good as you can get. The only problem I see with it is that the stock power connector has been replaced with a more common computer-style power connector and whoever did it was certainly not a surgeon. Pretty rough job but it works ok. The dial needs to be tightened up a bit, too. Otherwise it is very, very nice. Asking $275 plus shipping from 68132 or will trade for Timewave ANC-4, Ten Tec filters for the Omni V, Heathkit 2060A tuner, or about anything else interesting that you have laying around. Can email pictures if you would like.

I have for sale a Hallicrafters HT37 transmitter that needs a good home. I bought the radio a couple of years ago as a project and will proabbly never get to it. The radio is in poor condition. The driver and final tubes are missing, condition of the others is unknown. Case was bent during shipping due to poor packing by the previous owner. Some knobs are chipped, glass looks intact. Could be restored with some effort. I can send pictures if you'd like. Asking $100 plus shipping from 68132. This thing is heavy, so shipping will be very expensive. Pickup in Omaha, NE or nearby would save you some $$, but I'd be glad to ship UPS or Fedex Ground.

Respond via email to jcamp2@cox.net.

Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors

I have a pair of Drake T4XC transmitters, one working one not. The non-working one is in absolutely beautiful condition cosmetically. Front panel looks like new. No power out. If you can fix it you'll have a collector quality piece. Will sell for $150 plus shipping from 68132. The working one is about an 8 cosmetically and has had the Drake mic jack replaced with a standard 1/4" jack. Some scratches, no dings or dents. Asking $225 plus shipping from 68132. Will sell you both for $345. Would also consider trades for Timewave ANC-4, Heathkit SA-2060A tuner, or whatever else you have laying around.

Please respond via email to jcamp2@cox.net.

I have for sale a Drake TR4C transceiver in very good condition. A small fan has been added on the back to keep the finals cool. Case has a few scratches, but no dings or dents. Cosmetically it's an 8.5 or 9, electrically it's a 10. I used this rig daily for about a year and really enjoyed it. Asking $325 or would consider trade for Heathkit SA-2060A tuner, Ten Tec filters for Omni V, nice SB-230, 220, 221, or 2200, Kenwood D700, or whatever else you have laying around. please respond via email to jcamp2@cox.net.

This fellow is having an estate sale with military equipment
and parts. He isn't a "radio person." Need someone in
So.Cal. to contact him and go there. Downey area.
Please contact him direct; I'm just the "relay."
P.S. please save the "doodads" and small parts.
"Parts-catcher boxes" are getting hard to find
and you never know what
little knob or bolt will finish a restoration.
Thanks.

Secret Marconi Day Station - South Dorset Radio Society

Just to let you all know that the South Dorset Radio Society will be running a Marconi Day special event station from the little known Marconi site at Portland Bill. The site was used by Marconi to make first contact with Gibraltar.

It is so secret that the members don't even know about it yet and the RSGB have not published details of the special callsign. This is due to the fact that they don't want the Portland club knowing that they are invading for the weekend. So SSSSHHHH! Don't tell anyone.

Reply to Carol 2E1RBH, but don't look at the spelling on her emails.

HI,

Has anyone any info or a data sheet for a type 803 valve?

I looks like a large pentode, just a little taller than a 813.

RRH

904. FS/FT: Heathkit SB-401 for parts/restore, DX60T

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-21 13:51:19 UTC
From: Jeff Camp <jcamp2@cox.net>
Message-ID: <pHlSd.13255$ds.10192@okepread07>
Source record: 19393
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

I have a Heathkit SB-401 transmitter available for parts or restoration. It is missing the finals and the microphone jack. Other than that it looks to be complete. Asking $85 plus shipping from 68132. Also have a DX-60T transmitter. Got it on a trade a couple of years ago. No dents or dings, some yellowing on the paint. The previous owner claimed it works, but I have never tried it out so you're on your own. Asking $75 plus shipping. Will trade for Timewave ANC-4, sound card interface, or whatever (always looking for interesting stuff).

Please reply to jcamp2@cox.net.

73, Jeff N0WJP

905. WTB: Hallicrafters S-20R

Newsgroup: rec.radio.amateur.boatanchors

Message-ID: <ELISd.13256$ds.1564@okepread07>
Source record: 19295
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors

I'm looking for another Hallicrafters S-20R for a restoration project.
If you have one laying around that you'd like to dispose of, please
email me and maybe we can work something out. I would also consider
other Hallicrafters receivers.

I posted some stuff I have for sale both yesterday and today and would
be willing to work out a trade for the S-20R using that stuff.

jcamp2@cox.net

906. Free Heath IO-18 scope, Washington DC area

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-21 15:20:48 UTC
From: shoppa@trailing-edge.com
Message-ID: <1108999248.558912.301880@o13g2000cwo.googlegroups.com>
Source record: 19294
Cross-posted to: rec.radio.amateur.boatanchors,sci.electronics.equipment

For any hobbyists/hams who are interested, I have a mostly working, mostly intact Heath IO-18 oscilliscope available for pick-up. Give it to your kids to play with, use it as a station monitor, I don't care, I just want it to get some use in a good home.

I don't know what the official specs of the IO-18 are but bandwidth realistically is not much better than 100kHz or so. It's tube-based but not ridiculously big or heavy.

It's free, you must pick up in suburban Washington DC. E-mail me (shoppa@trailing-edge.com) for details.

Tim.

It takes a minute to search for the 803 data sheet on google:

http://hereford.ampr.org/cgi-bin/tube?tube=803

I used that tube many years ago. It is pretty similar to an 813, but not recommended above 20 MHz.

I looked at an S-20r offered on consignment in a local shop called
Pastimes Antiques (607-277-3457) a couple of months ago. The actual
owner returned my call but wanted over $200 for it which was way too
rich for my blood on that particular radio. You could call the store to
find out if it is still offered... maybe the price is would be more
realistic by now.

Hi all I am helping a friend promote a web site. You see a childhood friend of hers lost her husband at the World Trade Center on Sept. 11, 2001. She has run into some hard times and my freind wants to help her. So she came up with the idea to market Just say NO to Bin Ladin dartboards and punching bag covers. Not only is she going to donate part of the proceeds to her freind but an additional part of the proceeds will go to the Firemans Fund. If you could take the time to check out the web site it would be much appreciated!! The web site addy is:

Hi,

Thanks for the link, I did a google but used the word valve rather than tube, must remember that for the future when searching for American valves.

It's going in a HB CW TX, 6j6-807-803 on 80 and 40. If I can find a mod transformer big enough it may even end up on AM now that we have the band extension on 40.

913. ? Miss something obvious -S-38E ??

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-21 18:30:27 UTC
From: William Mutch <wcm1@NOSPAM.cornell.edu>
Message-ID: <MPG.1c83f2cb28e9cef49897f1@newsstand.cit.cornell.edu>
Source record: 19302

I was listening to my most modest boatanchor, an S-38E, at the
ktichen table when it suddenly, in mid broadcast, came on with a massive
raw AC hum on the output.
By way of diagnostics I downloaded the manual and schematic from
the BAMA site.
I changed out the 3 section filter electrolytic and the cathode
bypass on the audio out tube with new, tested caps. No help.
I checked the rectifier (35W4) and all other tubes for heater to
cathode shorts on a good Hickok tube tester. Replaced the rectifer with
the best of three available. Still hummed.
Recapped all caps in primary 117 vac to dc supply and audio output
stage. Still hums massively.
I've already got more in time and parts than an S-38 is worth in
this project. Anything obvious I should have thought to look at before
I give up ??

You might try subbing the AF output tube. Tube testers occasionally
miss some H-K problems.

Before doing anything else, substitute the audio output tube.
As I recall, that's a hot chassis radio with a 50C5 output tube, so
also check the power line filter caps and the the rubber isolation mounts
that keep the chassis isolated from the case.

I can't seem to get the schematic off of BAMA... it tells me that I don't
have permission. So I am not sure if the audio gain pot tap goes right
to the grid of the 50C5 or not... but it might well.

Here are a few items for sale. Prices do not include shipping. I will
ship overseas.

Coax Relay with Type "N" Connectors.....$30 plus shipping
26.5 volt dc relay. The relay works and is in excellent condition
http://members.cox.net/radiodx3/coax_relay7.JPG

HeathKit IM-10 VTVM.....$20 plus shipping
Huge meter, not so common VTVM. Works but needs some work
http://members.cox.net/radiostuff9/heathim10.JPG
http://members.cox.net/radiostuff9/heathim102.JPG

Old Telegraph Key- Ham Radio.....$30 plus shipping
Unknown manufacturer
http://members.cox.net/radiodx3/oldkey.JPG

Northern Engineering 100 KC. Crystal - 8 Pin Octal Base..$20 plus shipping
http://members.cox.net/radiostuff9/100kcxtal2.JPG

Marconi 100 KC. Crystal-Fits 7 Pin Tube Socket.....$15 plus shipping
Fits a standard 7 pin tube socket
http://members.cox.net/radiostuff9/100kcxtal.JPG

4 Section Transmitting Capacitor.....$25 plus shipping
Two sections measure 30-450 pF and the the back two sections measure
18-230 pf. This would be a great plate loading capacitor for a home
brew transmitter. The unit is NOS but is does have a bit of surface rust
on the plating. This in no way will affect performance
http://members.cox.net/radiodx3/cap82.JPG

Gear Driven Vernier Capacitor for Receiver or VFO....$20 plus shipping
measures 30 pf min and 150 pf max. I believe this capacitor is out of an
ARC-5 transmitter. This is a great precision capacitor for a homebrew
VFO or receiver project.
http://members.cox.net/radiodx3/vernier_cap3.JPG

3 Section Variable Capacitor for Linear Amplifier.....$25 plus shipping
Each section measures 15 pf min and 515 pf max. This would be an
excellent output capacitor for a pi-network in a linear amplifier
http://members.cox.net/radiostuff9/3section_variable.JPG.

NOS 6 and 12 Volt Vibrators for Military Gear or Antique Car
Radios.....$25 plus shipping
These are NOS 4 prong units new in the box. Tested and working
http://members.cox.net/radiostuff9/6v_vibrator2.JPG
http://members.cox.net/radiostuff9/12v_vibrator.jpg

Thanks for looking.

Cross-posted to: rec.radio.swap;,rec.radio.amateur.boatanchors

I have a Hammarlund BC-779B receiver with power supply for sale. Unit is a rack-mounted model and appears to be complete. I know nothing about these radios. Don't know if it works, and I don't have a manual. Included is what appears to be the power supply for it (marked as a RA-84 Power Supply Unit on the front panel). I have pictures of the radio posted at:

http://www.users.fast.net/~n3ab/bc779t.jpg
http://www.users.fast.net/~n3ab/bc779f.jpg
http://www.users.fast.net/~n3ab/bc779b.jpg

Asking $150.00 for the pair. These two items are heavy...No shipping! Items can be picked up or I can meet within 50 miles of my home (near Allentown, PA).

Thanks for reading!

John N3AB

Hammarlund HQ-120X Special. (special denotes the black faced front panel)

Recapped, new resistors where needed, retubed, aligned, cabinet repainted. Have a reprint of the manual, s-meter face is a reproduction, nice bright white and illuminated with an led (nicely done), works and looks great. minor scratch on the left upper hand front panel, original knobs. Works very well, no modifications, chassis is clean.

$150 plus shipping/insurance.

This is the radio that I asked for help in identifying. I've finally started on the re-capping job. While none of this will come as any news I thought I'd post it anyway.

On one side of the radio are two terminal strips one above the other with 4 capacitors and 4 resistors. The resistors are in front of two of the capacitors I plan on replacing. I removed two capacitors, after removal I tested them. They appear to be open, whether from age or the abuse of the de-soldering I can't say.

The other two caps in the same area require that I remove some resistors to get at them, so I measured the four resistors in the area. These measurements where made in circuit. My thinking is that if the reading is high the resistor must be bad, other components could only cause the reading to be lower.

Anyway, here is what I found:

Should be | Measured in circuit
47K | 70K
330 | 327
22K | 27K
68 | 156

Regards,

Bob

Time for my monthly chassis request. I recently acquired an RCA 13K console. The speaker is present but the chassis is missing and I'm hoping someone here has a 13K chassis they would be willing to sell. I'd even take another speaker if I had to.

I was told that the 15K chassis will fit into my cabinet as well and will work with my current speaker. If anyone has a 13K or 15K chassis they would be willing to sell please send me an e-mail.

Regards,
Geoff

What are you offering for the tube op amps? I should have one or two of
them, here somewhere. I saw one about six months ago in my shop, but
I'll have to find the right box to see if the other one was with it.

Sounds interesting! That 6J6 is going to get lost in there with those
big tubes. :)

Funny quirk about the 803 is that they require about 40V on the
suppressor grid. Don't know if that was common for power pentodes of
that era, or something special about the 803.

"7MHz Extension

Following further talks with Ofcom it is anticipated that the 100kHz
extension to the 40m band as agreed at WRC03 will come on stream at the end
of October. This will extend the current frequency allocation in the band
from 7000 – 7100kHz to 7000 – 7200kHz."

So far the UK, Norway, and Switzerland have access to the new section of
band, others will follow in the next 2 years.

A few stations over here are active on AM around 7.142, hopping to get on
there myself in a few weeks if I can get this project built and working, the
first two stages are just about ready, if I can find a mod transformer at
the next rally I'll have all the parts I need.

Okay, if you used a standard "audio taper" 3K pot, you would get:

Full left 0
25% 189
50% 450
75% 1500
100% 3000

This looks like a slightly different taper, but probably close enough
that you could get away with it by slightly altering the markings.

>Thanks for the suggestion to use a standard potentiometer that =
>approximately has the same behaviour and to paste a paper scale to =
>compensate for the difference. However, I will have to verify two =

You can get audio taper pots easily, which have a standard log scale.
Getting antilog pots is harder.

>- how much power the original potentiometer was supposed to dissipate. =
>It may not be easier at all to find high-power carbon potentiometers=20

Now THAT may be the rub. BUT you can still get audio-taper wirewound
pots for speaker level applications. They're getting harder and harder
to find, though.

Check the power supplies for open electrolytics or voltages that are
out of tolerance.

I had an old scope like that. I pulled out all the tubes and found several Bugle-Boys which I bundled together and sold them on eBay for $60 to the audiophools.
I then threw the scope out to the dumpster.

"Bugle-Boys" ? what are they, a type of vacuum tube? Do they say bugle-boy
on them?
Hmmm, I had no idea the tubes seperately might be saleable. Do you know
offhand, Pat, how to valuate vacuum tubes?
This is interesting. Anybody know how old this scope really is?

Thanks to all who helped me identify my radio. Once I had a name and model I was able find pictures and schematics on-line. My radio is missing the two chrome trim strips, the name plate, and the shutter mechanism. If anybody has any of these items I'd be interested in buying them. Lacking that, if any of you folks who own one could post pictures of the shutter mechanism that would help too. I might have to make the shutter or do without. I think it looks good without the shutter, but what do I know.

Regards,

Bob

From: COLIN LAMB <k7fm@teleport.com>
Message-ID: <mhPTd.5877$873.2562@newsread3.news.pas.earthlink.net>
Source record: 19253

The 515A was manufactured from 1957 to 1971. It is a general purpose scope with a bandwidth of 15 MHz. Value if aligned and working properly is about $75, however, an old scope is somewhat like an old piece of medical equipment. Those that need them buy something newer, and if you do not need them, they are not of much value. I like old scopes and have a number of old Tek scopes. I get them only because people give them to me and I would not pay to have one shipped. Most of the tubes in the 515A are so common that they have no real value.

You may be able to find a manual for downloading, but the scope is a complex instrument and it is difficult to diagnose by e-mail.

Value in present condition is to see if someone will haul it away, or try to fix it yourself after finding a manual.

Colin Lamb

965. Can you ID this Hallicrafters S-meter?

Newsgroup: rec.radio.amateur.boatanchors

I bought this thinking it would replace my exploded SX-28 meter, but as you can see from the photo, it's too small. My cruddy SX-28 meter is on the left (duh).

http://antiqueradio.org/art/temp/Hallimeters.jpg

Anyone want to buy it -- or know what it belongs to? The meter looks like new. My loss is your gain :-)

If not, maybe I'll try to use it to make an external S-meter for my S-20R (http://antiqueradio.org/smeter.htm , http://antiqueradio.org/magiceye.htm). I don't think they used this style of meter face after WWII.

On 25-Feb-2005, "tom" <cyberhun@shaw.ca> wondered:

> "Bugle-Boys" ? what are they, a type of vacuum tube? Do they say
> bugle-boy
> on them?

It was a logo used on some Amperex tubes. Sort of a cartoon drawing of a vacuum tube playing a bugle.

They are standard tubes, but allegedly built to tighter standards. Probably like resistors used to be- somebody made a whole batch of some value, then measured each one. The ones that were within 20% tolerance had a 10 cent price, the ones within 10% had a 25 cent price and the ones that happened by sheer chance to be within 5% sold for much more.

Rumor has it that God himself (herself?) uses only genuine Bugle Boys in his (her) hi-fi.

Phil:

as the new meter is smaller, until you find another that is the correct size,
why not just mount the one you have on a black plastic or metal ring in the hole
the old one came out of? Of course, it won't look quite right, but will at
least read correctly until you can find the larger one for your unit.

Thanks

970. PileupBuster.com - Domain Name is For Sale

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-26 05:22:34 UTC
From: erfurth@gmail.com
Message-ID: <36ba001b.0502252122.2977d540@posting.google.com>
Source record: 19259

-NOTICE-

The "PileupBuster.com" domain name is For Sale.

For less then the price of an HF rig you can own the ultimate Ham Radio domain name.

The PileupBuster.com domain has immediate name recognition to everyone associated with Ham Radio. Plus, the sales and marketing potential of this name is unlimited.

The minimum offer on this domain is $1,250.00 (US Dollars). The PileupBuster.com domain name will be sold to the person, company or group that makes the highest offer. International offers are welcome.

This is a Private Auction. No one will see what you offer and you will not be able to see what others are offering.

You may begin submitting your offers on Saturday February 26. No offers will be accepted after 12:00 midnight (Pacific Time) on Friday March 4, 2005.

TO MAKE AN OFFER, GO TO: http://PileupBuster.com When the web page comes up, look right under the PileupBuster.com name. You will see "This domain is For Sale" then click on: "More detailsï¿½" You will then see a box to enter your offer. Enter your offer and then click "Make Offer"

This sale is supervised and regulated by SEDO (sedo.com), a highly respected International domain sales company.

If you have any questions, please feel free to contact me at: erfurth@gmail.com

Good luck.

73s,

Bill

Good eyes! The photo in the Halli book definitely looks like a match.

I wonder if I could use this meter as a sub while I continue the search for the real thing?

According to the book, the R-45/ARR-7 is a contemporary of the SX-28 and electrically very similar (except for phones-only audio and external power supply).

Theo -

OK. you have a Kenwood TS-520.

Do you have the TS-520 Service manual - that identifies the Kenwood TS-520 parts by
their original part numbers?

The TS-520 Service Manual (ZIP file of Adobe Acrobat) is a LARGE file available (download) from MODS DK
http://www.mods.dk/view.php?ListManuals=kenwood

Are you aware that about 86 parts for the TS-520 model are still available from Kenwood Parts?

Many are switches - BUT there are multiple parts (and specific wafer numbers).
You will need to Kenwood part number for the specific bad Mode Switch wafer (hence the reason for the Service Manual).
http://www.kenwoodparts.com/parts/search.php

No you instruction manual will NOT have this information, BUT the TS-520 Service Manual does.
BTW, your automobile's owner's manual rarely has part numbers, BUT the service manual for your automobile DOES !

The Kenwood TS-520 service manual identifies all of the radio's parts by original Kenwood part numbers.

The TS-520 Service Manual (ZIP file of Adobe Acrobat) is a LARGE file available (download) from MODS DK
http://www.mods.dk/view.php?ListManuals=kenwood

About 86 parts for the TS-520 model are still available (not discontinued) from Kenwood Parts (Eastern US).http://www.kenwoodparts.com/parts/search.php

Pacific Coast Parts is the Western US distributor for Kenwood parts.

983. National S-meter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-02-26 18:12:41 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <t_2Ud.594315$b5.27111394@news3.tin.it>
Source record: 19272

I just got a National NC-125 receiver. All the NC-125 pictures I have seen show a black-on-white S-meter. Mine instead has a black plate, with a white needle, the NC logo in red, the 0-9 scale in yellow and the 9-9+60 scale in red.

Does anyone know whether it is orginal?

It should work. You would have to create an adaptor so the smaller meter
body would fit in the larger hole, but it would work better than what
you've got now.

>
> According to the book, the R-45/ARR-7 is a contemporary of the SX-28 and

The R-45 is essentially an airborne SX-28 with an added zero-gain RF
stage to keep RF radiation levels down to prevent enemy radar from
homing in on the receiver while in use. I have one in the queue and it
looks like it will be easier to work on than a full-blown SX-28.

Your HQ-180 front panel can be redone by W4PNT, Dee. I don't know about
the cabinets, themselves. Dee has a website. Its called Patty and
Dee's Marina.... as I recall.

INFO: Johnson Viking Invader 2000
Hi I have a VERY nice Johnson Viking Invader 2000
I just got it. Front panel id excellent and chasis is
very nice also.

Now the problem at hand....The cabinet needs painting and the bezel
that goes around the front cabinet needs to be repainted.
I noticed the cabinet is a crinkle paint and the front bezel is a
different crinkel paint.
Does someone sell this type of crinkle paint to spray on???
Any help would be appreciated.
I really like this gem.

I have 4 Philbrick tube chopper modules GAP/R USA-3. They have 3 12AX7 tubes and a 6S4 with a GAP/R MODEL 3 ...6.3V 50-60HZ chopper. They do not have the "amber base". I may have some of the black potted solid-state op-amps from
Philbrick, Philbrick/Teledyne, & Nexus but would take some digging to find them. The 12AX7 tubes are marked: GAP/R COMPUTER TUBE 12AX7/ECC83 made in West Germany... I think these are the tubes prized for the HiFi amps?? These units look to have never been used.. I think the tubes might be worth much$$?? I would be curious why you would be collecting chopper units?

-------- Original Message --------
Subject: [Amps] FS:DENTRON CLIPPERTON V 2meter amp- JUNK!!!!!
Date: Sun, 27 Feb 2005 13:48:40 EST
From: JimMoci at aol dot com
To: amps@contesting.com

I have for sale a Dentron Clipperton V 2 meter amplifier rated @ 500 watts input with a 4CX250B. It is in pretty good cosmetic shape except for a small
ding in the left corners. As far as working condition goes it does work but I
think this amp is a piece of junk! (Hey I am honest) It has an LC tank circuit-
it is not a stripline design like it probably should be @ 2 meters. It runs awfully hot and has a severly under sized blower. The tank circuit is under sized and runs very hot- so hot that it melted the solder running 200 watts FM. At
300 watts out it runs fine on SSB but I think it is still way to hot. These junkers are going for $600-700 on Ebay. Why? I dont know why but my guess would
be a solid state 300watt amp is $700 and you still need an Astron RS70 to run
it. I think it would be fine if someone installed a much larger blower but that would require hacking the cabinet which would ruin the collectability of
the amp. At least it would be functional and reliable then. Better yet would be
to convert it to stripline- there is enough room with some cabinet work and hacking. It would also be an excellent candidate for a six meter conversion where a conventional tank design is usable with a 4CX250B. I would like to sell
this Denny Dentron junker -boatanchor for $550 to someone who can appreciate it
for what it is!! :)
Thanks & 73, Jim W3ATV

Hello,
I'm totally new to tube project. I recently found two PCL86 and I was
looking
for simple schematic to start with. I found lots of transmitters and a
good
amount of regenerative receivers schematics. I was wondering if it's
possible to build any kind of single (or even two) tube tx-rx for the
same frequency (even a
fixed one in the 80m or 40m bands) perhaps using the same xtal
oscillator
for both receive and transmit sections. Don't flame if I'm just
telling nonsense
HI.

>HI.

It's possible, and there are some walkie-talkie circuits that are
a Pierce crystal oscillator when the key is down, and then reconfigure
themselves into a regenerative receiver when the key is up. This
means the key consists of a whole heck of a lot of contacts. I think
the old PRC-6 might be something worth looking at.

BUT, I think you're probably going to have an easier time building
a seperate transmitter and receiver and putting them on the same
chassis. Check out the ARRL Mobile Manual for some really neat
tube-type transceiver projects, some of which are quite small.

It is a good amp, if you use it to its rated output.
The 4cx250b is only rated for 250w plate output. Trying to get more from
that tube will shorten life, and produce much more heat.
I have used that amp running at 150w out and it just gets warm, and it
is solid performer.

"Scott W. Harvey" wrote:
> It should work.

Yes, it does work, if I reverse the leads to the meter. However, it's too small, the dial background is white, and it has no pilot lamp. I think I'll stick with my backwards-working but otherwise functional SX-28 meter for now, and use this in some other project.

Interesting that the dial face on this meter is as white as new, whereas SX-28 meter faces all faded to orange-yellow over time, even though both radios are contemporaneous. Maybe the military specs called for a different material . . . ?

Ron in Radio Heaven wrote:
>
> I think we need to work on the definition of "rare",
> much less "quite rare" when it comes to old radios....

These are pretty good guidelines, Ron, and in line
with the "Scarcity Scale" I advocate in the
Military Radio community. To make it relevant,
it is based both on the number of know examples
in private hands (those in museums are not likely to
be available to collectors and therefore, in practical terms,
don't exist) and the likelihood of a collector
obtaining one.

0: Extinct- No examples of this set are known
to survive in private hands.

1: Unique- Only one is known to exist.
Confirmed prototypes and manufacturer's
"morgue" sets belong here.
Finding one is a happy accident.

2: Rare- Less than ten of these sets are known to exist.
You may acquire one or two in a lifetime of collecting.

3: Uncommon- Enough of these sets remain that 3-5 years
of effort will add them to your collection.

4: Common- This set can be acquired in a short time
with modest effort.

Some folks advocate a step between 2 and 3, but
I don't see a need for it. These five define
scarcity pretty well, IMHO.

Kindly,
David S.

I submit that in our specialized field, ten is a good number.
The point is that a "rare" set should be very difficult to acquire;
that it should take a large portion of effort and time to find one,
so that you can expect only a couple of such sets
to come to your collection.
This separates the most prized sets from the "Uncommon,"
which also require time and effort to find,
but not to the degree a "Rare" set requires.
An "Uncommon" set should be a source of pride and satisfaction.
A "Rare" set should feel more like a blessing.

Kindly,
David S.

If you want to get into tube homebrew you'll want to join the glowbugs mailing list which is dedicated to just that area. They're also a good group of folks, and they will _not_ flame you for your questions. Here's the sign-up info:

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

I agree with the other comment you received, which is to build the transmitter and receiver separately (you can use a common power supply). The PCL86 (14GW8) should make an excellent transmitter running about 10W input. The other PCL86 could be used in a regenerative receiver, but you might want to add another tube or two for either an isolation RF amp and/or another stage of audio amplification. Join up with glowbugs and you'll have a bunch of folks suggesting possible designs. In the meantime here's a link you should enjoy:

Seems to me that there's a bit of a disconnect in the "rare" definition.
if only 10 of any item are known to exist and one may expect to have one
or two in a lifetime of collecting, these 10 units would really be doing
a hat-dance getting around to all the collectors. Having said that,
it would truly be nice to have some sort of standard of comparison.
But, I suspect the collector will have to continue to sort the wheat
from the chaff. Now.. about this WW2/Korea/Vietnam secret radio I found
in my Grandmother's barn that was fully functional 20 years ago.....
very rare...!!

I think the work "Rare" needs a lot better definition. If there were only a 1000 made of an item and there was a 1000 people that ever had a desire to owe one then it is indeed common but it there were 1,000,000 people that wanted one then it is indeed not a common item but a rare item. The work "rare has to be used with respect to the number of items built and the demand for that item. There are a lot of items that have less than 10 built that might be "rare" by the definition given but no demand.
Maybe different words need to be used:

Extremely desired item (Everybody wants one and price is no object)
Highly desired item (Everybody wants one but price is an object)
Low desired item (Only a few want the item and price is lower)
Undesired itme (you pay the junk collector to take it)
a true anchor item (You take it to the grave with you)

Dow-Key and Dow-Key Clone Antenna Relays
These are all 110 volt relays. All have been tested and are working. These relays have no external contacts unless indicated

Quantity of 2- Dow-Key.....$35 each plus shipping
http://members.cox.net/radiostuff9/dowkey1.JPG
http://members.cox.net/radiostuff9/dowkey2.JPG

Quantity of 3- Dow-Key Clones.....$35 each plus shipping
These look like they are more rugged
http://members.cox.net/radiostuff9/relay98.JPG
http://members.cox.net/radiostuff9/relay99.JPG
http://members.cox.net/radiostuff9/relay4.JPG

Quantity of 1-Dow-Key Clone with 2 sets of external contacts.....$45 plus shipping
http://members.cox.net/radiostuff9/relay2_contacts.JPG

Quantity of 2- Price Electric Relays.....$40 each plus shipping
These have N-connectors and are extremely well built. I believe they are VHF/UHF relays
http://members.cox.net/radiostuff9/uhf_relay.JPG

Precision E-200-C Signal Generator.....$60 plus shipping
This is a nice vintage signal generator covers 90 kHz to 120 MHz. It has two separate adjustable RF outputs as well as internal modulation and adjustable AVC voltage. The tuning dial even has a smooth vernier movement. This unit has been tested and works great but it does have considerable chipped paint. This is an excellent unit for your test bench if you are restoring boatanchors or antique radios! Includes a photocopy of the manual.
http://members.cox.net/radiostuff9/precisione200c.JPG
http://members.cox.net/radiostuff9/precisione200c2.JPG

Square D High Power Antenna Switch- SPDT, NOS, NIB.....$25 plus shipping
These are NOS circa 1945 giant knife switches. Put this in your shack and give literal meaning to "I am going to throw the big switch".

The base of this switch is roughly 10 inches long so this is a "big" switch.
http://members.cox.net/radiostuff9/big_switch2.JPG
http://members.cox.net/radiostuff9/big_switch.JPG

Giant Mirrored Scale Microammeter.....$20 plus shipping
FS = 500 micro amps. Meter is 6 inches wide by 4.5 inches high
http://members.cox.net/radiostuff9/bigmeter.jpg
http://members.cox.net/radiostuff9/bigmeter2.jpg

100 kc Octal Base Crystal.....$20 plus shipping
http://members.cox.net/radiostuff9/100khz_xtal4.jpg

Hallicrafters SX-28 Back Panel Binding Posts.....$25 plus shipping
These are NOS Millen parts. I believe these are the same ones on the
back of the SX-28. I canï¿½t get to the back of mine to check 9 sound
familiar?). Dimensions are approximately 2 inches long by 0.75 inches
wide. Terminals are 0.75 inches apart
http://members.cox.net/radiostuff9/binding_posts.jpg

Thanks for looking.

>but not to the degree a "Rare" set requires.

I'm with David on this one. I think the "rare" distinction
puts an object into the realm where, even if you were willing
to sell the kids and mortage the house, you still ain't going
to be able to just waltz out and buy one for $$$$$. Luck becomes
a major factor in the game.

>An "Uncommon" set should be a source of pride and satisfaction.
>A "Rare" set should feel more like a blessing.

Well put.

Not at all. There are only <10 of one set,
but many different kinds of sets of which <10 are known.
Therefore, you can have any number of "rare" sets,
just not of the same kind.

1035. Hotel reservations for Charlotte Conference

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-03-02 23:58:22 UTC
From: Ron in Radio Heaven <kc4yoy@carolina.rr.con>

I just got off the phone with the Sheraton Hotel,
they have added to our room block and extended
to cutoff date for getting rooms for the Charlotte
Conference special rate of $79.

This was prompted by a call from one of our attendees
that had tried to make reservations and was told that
all the rooms in our block were taken and all that was left were
well over $100 a night.

Don't get me wrong, this is a good thing,
it means that lots of folks have already made their
reservations.

If you would like to stay at the Sheraton
please call 704-392-1200 and make your reservations.
It helps if you call during regular business hours
so you can talk to someone in Charlotte, instead
of someone at their national reservation center
that might be in Bombay...

The show will be here before you know it.

See ya soon.

My FT 101E has developed a slight attenuate problem, but only after keying up, in other words I turn the radio on the receive is nice and strong and will be fine until I hit the key, once Im done keying up the receive goes down about 3-5 db, signals that were 7-9 are now 3-5 and the only way to get it back up again is by shutting the rig off and back on again.

Comments and help appreciated, thanks

I just got email from a guy who checked a 90+ pound military boatanchor as a piece of LUGGAGE on a flight from the UK to the US. This was some time ago, so apparently he wasn't charged for the extra weight.

I'm amazed that it survived, even if packed in a box. Can you imagine the bang when that thing came rocketing down the conveyors?!

:-)

I can certainly second that - it is a classic symptom of badly worn relay
contacts on the FT101.
Don't attempt cleaning - replacement is the only permanent cure.
Since the relays are no longer stocked an actual direct replacement
is going to be tricky.
Although the pin configurations are same as other more common relays,
on the Japanese relay the middle row of pins are juxtaposed in pairs, so
before you fit a new relay you will need to swap over the wires on each pair
of middle pins on the relay base.
But check both the relay pinouts first!

I used that approach to shipping when our family went to Holland in
1995. My Dad, my brother, and I each bought a european table radio, plus
one of my uncles gave us one as well. We packed them in cardboard boxes,
and dropped them off at the "special baggage" area on our return flight.
Everything arrived in one piece. They were about 20-25lb each, packaged.

It seems that most military gear should be designed to take some extra hard abuse. I just would not want my luggage at the bottom of the chute when it came sliding down!!

********** Old Radio Knobs **********

Note: I'll take $100 for the lot... plus shipping

These are all used, most have set screws, with nothing worse than minor scuffs and smudges and fit 1/4" shafts, unless noted.

Dakaware $25 all
1-1/16" Knurled Knob (2)
1-1/16" Knurled Knob w/ 1.5" skirt w/ white indicator line (2)
1-1/16" Knurled Knob w/ 2" skirt marked 0-10 (1)
1-5/8" Knurled Knob w/ 2-1/16" skirt & unfilled indicator line (1)
2-3/8" Knurled Knob w/ white vinyl pointer at skirt level (2)
2-3/8" Knurled Knob w/ 3" skirt & unfilled indicator line (1)
2-1/16" skirt only

Harry Davies
#1206 1-3/8" knobs 10 for $10
Short (1-3/16")pointer knob unfilled indicator line -- Not sure if this is Davies... There are a box of these -- 3/$1

Kenwood 5cm diameter knobs that look like they are from a Kenwood TS-830 (main tuning knob) or similar
One that's been backfilled with shot to give it some heft -- $7
The plastic spinner version -- $15

Kurz-Kasch

-- 300 series, 30+ parts, $50 for all --

#308 1-1/8" knob (5)
#385 1-3/8" knob (4)
#309 1-5/8" knob (8)
#310 2-3/8" knob w/metal spinner shaft (3)
#310 2-3/8" knob -- hub drilled out to 3/8"

#380 1-1/8" skirted knob (4)
#308 1-1/8" knob w/vinyl pointer
#308 1-1/8" knob w/ 1-3/4" black metal skirt w/ 100 graduations over 180 degrees
#308 1-1/8" knob w/ 1-3/4" brite metal skirt w/ 100 graduations over 360 degrees
#309 1-5/8" knob w/ metal spinner and 2-1/4" black metal dial with 100 graduations
#309? (may not be KK) 1-5/8" knob w/ plastic spinner and 2-1/4" metal dial with 100 graduations
#311 2-1/16" skirted knob (some of the white lines are need

refilling on these) (5)

-- 600 series 10 parts, $20 for all --

These look like what was on some '60's Hammarlund, Eico & Knight
Kit stuff
#642 1.5" skirted knob (1)
#S-645 .75" skirted knob w/indicator line (1)
#647 1" skirted knob w/indicator line (3)
#653 1.5" skirted knob w/indicator line (5)

National HRT 2-1/16" diameter. Black, trim rings somewhat tarnished --
$5 ea

There are also many knobs from 1960's Tektronix and Hewlett Packard
oscilloscopes, if anyone has any need, please inquire.

All of the above plus shipping, if necessary, naturally.

Contact: Marv WC6W 310 649 3111 (reasonable hours Pacific Time
please)

That wouldn't work now. A 90lb package would be overweight and
guaranteed to require a sizable fee (unless you know the gate
agent...hi!!). But... at least you'd know where it was!!!!!

I watched the Airtran folks load luggage onto planes when we were
waiting around Atlanta airport Saturday. They were tossing bags with no
concern about the contents.

S'Ok. If I ship an EK-07 or an FRR-59, they won't be tossing it.
They'll be heaving, and then finding loops of gut poking through
suddenly-expanded holes in their abdominal walls. Maybe an R-390 or
an R-1051 as "bag two of two", just for chucks.

You should see what I've taken as "carry on" luggage on an AMTRAK train!
Shop the bargain fares and a round-trip ticket can be less than shipping
for a medium serious boat-anchor.

I've "shipped" two R-390s that way.

1060. differences between HW101 and SB101?

Hi Gang,
This is probabaly a dumb question, but is the Heath HW-101
and SB-101 basically the same? The reason I'm asking is that
I already have a decent HW-101, and I was just offered an
SB-101 for a very reasonable price. If the SB-101 is a much
better rig, I may buy the SB and sell the HW.

TIA.

From memory, they are pretty much the same, with the HW being
the economy model. The dial is supposed to be better on the SB,
and I think there's a few extra features on it, but the circuit is
basically common to both.

Get the SB-101 unless you really love the HW-101.

The SB-101 has the tube version of the LMO, 1 kHz frequency readout, compare to the, what, 5 kHz dial on the HW-101. The SB-101 is more stable too.

A little discussed feature. The HW-100 has a broad slope SSB filter. I don't know if the HW-101 uses that or the 6 pole SB filter. If it has the HW-100's filter, which I believe is a 4 pole, then, for that reason alone, the SB-101 is a better choice.

Either way, though. Both are good radios and plenty good enough.

Why not get the SB-101, run your own comparison for 6 months or a year, then keep one and sell the other.

1066. Re: differences between HW101 and SB101?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-03-04 19:42:23 UTC
From: k5dh@raytheon.com
Message-ID: <zS2Wd.1$EY1.0@dfw-service2.ext.ray.com>
Source record: 19156

I've owned and restored literally dozens of the
HW-100/101 and SB-100/101/102 rigs over the years.

To build on what AH6GI has correctly stated...

The HW-100/101 have a traditional VFO, while the
SB-100/101/102 have an LMO (linearized master
oscillator) which is much more stable. The '102
has a solid-state LMO, while its predecessors have
tube-type LMO's. The HW-100/101 VFO is tube-type.
As AH6GI stated, the SB-line rigs have a better
VFO frequency dial arrangement.

The HW-101 and SB-102 use the same SSB filter, and
it's very selective. Both can handle the optional
400 Hz CW filter, which is VERY selective.

As a side note, you can use the Heath filters in
a Kenwood TS-520/520S/520SE and vice-versa, since
both use a 3395 KHz i-f!

There are other minor circuit differences between
the Heath rigs, and some physical differences too.
The SB rigs have the VOX controls inside the rig,
up on top, accessible through the hinged lid, while
the HW-101 has them on the lower side of the cabinet,
harder to get to. The SB-102 has more metering
functions than the HW-101, although the meter itself
uses the same movement. The SB-102 has capability
to use an optional (somewhat scarce) remote VFO,
and the HW-101 does not have this capability.

The SB-102 is a better rig from a stability and
user-friendliness standpoint. Performance-wise,
they're a dead heat. The lion's share of the
circuitry is virtually identical.

If you have your choice for about the same cost,
buy the SB-102.

73,
Dean K5DH

1067. National NC-109 with problems

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-03-04 19:56:37 UTC
From: arne thormodsen <arneDOTthormodsen@REMOVE.hp.com>
Message-ID: <V33Wd.1009$_36.821@news.cpqcorp.net>
Source record: 19155

(previously posted to rec.antiques.radio-phono)

My dad recently gave me a National NC-109 bought at a surplus auction. It works but has a problem. There is a "dead space" at the bottom of each band. It's totally silent down there, no scratching, no whistles, nothing. For example, I can't tune regular AM broadcast below about 650. As the radio warms up the problem becomes worse, after an hour I can't tune below about 750. The problem is similar in all the bands, but less severe in the higher ones.

Otherwise the radio works fine, and stations come in where they should on the dial when I can get them. Thanks to the folks at rec.antiques.radio-phono I've got a schematic and a manual now, as well as some pointers to look at the local oscillator. I've not done anything with tube electronics for decades (since I was a kid), but I'm looking on this as a project to maybe get back in. Would the simple, dumb (and expensive) step of replacing all the tubes be at all useful? Unlike when I was a kid at least I have money now... ;-)

Thanks in advance for any advice about how to go at fixing this problem,

--arne

1068. Scott SLRM - Figuring out the value

I'm trying to establish the value of a Scott Marine Radio SLRM. The radio is complete and in very good condition including a working magic eye. I also have the manual for the military equivelant, the CZC-46270 Radio Receiver. The manual is clearly aged but is also complete wih no missing pages including the fold out schematic in back. I've checked ebay and the web but apparently these aren't particularly common. Either opinions or pointers to other sources of information would be appreciated.

Thanks

Yup.
I was waiting at the LA station for the train to San Diego. I watched baggage staff (men and women) loading baggage into the Southwest Limited's baggage car (the direct train between LA and Chicago). The people were careful. As far as I recall, the rates are high, and they don't run everywhere, but it may be worth it. Trans-shipment (where most damage probably occurs) is minimized because you deliver and pick up at the station.

On the other hand, if certain federal politicians keep trying to zero out Amtrak's paltry budget, there may be no more passenger trains to ship on.

I once went out with a driver making pickups in Manhattan (he drove a big truck for a small courier company). The end of the run was at the Pennsylvania Station Post Office, where I watched the driver hurl packages through the air, aiming at chutes in the floor, while verbally mocking the "fragile" labels. Postal staff were yelling at him.

My thoughts are that it's easy for people to be callous about these things when the work is monotonous and routinized, and especially when they don't like the folks they're working for. UPS is known to treat their employees with the same compassion that they use with their customers. Imagine your experience of

"employee loyalty" if Wal-Mart was in the express business. On the other hand, Amtrak is mostly (not completely) square with its employees; maybe that has something to do with the considerate baggage handling that I observed in Los Angeles.

Richard

I frequently fly with Czech Airlines between New York and Prague - three to four times a year. The maximum weight of each of two allowed checked-in luggages is 32 kg (70 lbs) and as a Frequent Flyer I am entitled to 10 kg excess, i.e. one luggage of up to 42 kg (93 lbs). I have checked 90+ lbs boxes several times and they even got "Priority Handling" status due to my Frequent Flyer status. On one totally full flight my large box filled with junque arrived while some other people's bags did not.

When the Olympics were held at Salt Lake City there was a local
brewery with a sense of humor. They ran ads with the taglines:

"The beer to have when you're having more than one."

and

"Bring some home for the wives."

The tuning capacitor is damaged, probably by someone who tried to fiddle
with the plates to adjust the tuning. It shorts out at the bottom of the
dial. I bet a nickel. Not a dollar, but at least a nickel.

My guess is probably some bent plates on the main tuning capacitor. I wouldn't bet the farm on it, but at least the barn. It would be really easy to check by just doing a continuity check between the stator and the rotor. You might even feel some resistance in the tuning knob when you hit the noisey section. With a little care you can bend the offending plates back into position. Have an old RCA AA5 that still works to this day after my Elmer showed me how to fix it 25 years ago. Cheers. de W8IJG

Im going to have to second or third the two previous posters. Had similar problems in the past and it turned out to be slightly bent plates touching and shorting out at the bottom and can be bent back in place carefully.

The classic method of dealing with this problem is to use the curbside check-in and tip the skycap generously. I have never done this with a boatanchor, but I have shipped several bikes this way and have always avoided the $55.00 flat rate fee for bikes.....

One time, I bought a trans-oceanic at a tag sale in Connecticut just before a flight (literally on the way to the airport, so no time to box it up). My carry-on allowance was already used up, so I checked it as luggage as is, and it went from New York to Portland,OR unscathed.

I don't recommend this, however.

-Scott

To confirm the diagnosis, you should probably hear a sudden decrease of the background noise at the point the capacitor plates touch each other.

Not really. There's loads of stuff on "careful packing" for shipment,
and the kit is normally mounted on shock absorbers for mobile use.

All too believable, I'm afraid.

I had a *well packed* - lots of bubblewrap, foam rubber, etc - WS19
shipped by UPS last year. It was mint (unissued) when it started out,
and arrived with every single case surface dented, and one of the
"brush guards" (strong metal grill to protect the front panel from
operator boots, etc) severely bent).

I said at the time, I wouldn't trust them to ship an anvil safely,
unless it was surrounded by a metre-thickness of bubblewrap.

More recently, I had this to say to another poster (Hi Mike!):

>I only bought the 141 because it was local and I could collect - I'm
>beginning to see the wisdom of the military packaging instructions in
>one of my signals manuals: "It should be remembered that goods in transit
>receive very rough handling, a free drop onto concrete from a height of

>to meet these conditions".
>
>They've used UPS, I can tell....

UPS and CityLink are now on my "under NO circumstances whatsoever" list,
while Parcelforce (the package destruction arm of the Royal Mail) are
rapidly heading in that direction for failing to deliver a parcel (or any
notification thereof) on Christmas Eve, and then returning it to sender
(again without any attempt to contact the office - which is manned 24x7).
I'm now waiting for it to arrive back in Canada so I can have it reshipped
by some reliable service...

Chris.

Hi,
I bought an E.H. Scott RCH last yr, price on it was $150, it was
working. Not exactly your unit, but I do have some pix on a webpage,
incl. one with the magic eye:
http://www.thecompendium.net/radio/ScottRCH.htm
I've been considering selling mine, after doing some work on it &
realizing it needs a place to sit, and stay. It's heavy, 80-90 lbs I
think. Don't know what price I should put on it now either, so would be
interested in what you hear.

I have 3 or 4 of them and paid prices from $35.00 to $200.00 for them.
Yours sounds like it belongs on the high end of that range.
I had thought that they were a rare item but there seems to be lots of
them out there.
A nice swl rig but a little lacking as a ham receiver. Enjoy it. 73

The VFO's on the HW-100 and 101 were terribly unstable, no matter how well you built-rebuilt them. To many structural stress points that changed with temprature, defective coils, a transistor junction as a VR, improper drive coupling

The SB-101 used a brick solid temprature compensated factory built TRW LMO on a pinch drive that could expand and contract with temprature.

For the SB-102 Heathkit dropped the good TRW's and went back to a cheap flimsy thing marketed as the "New and improved FET LMO".
Most of these LMO's aligned with the tuning capacitor trimmer screws all the way out so if you put you coffie or D-104 down to hard the set would jump a couple hundred Hz.

Keep the SB-101, Id say its the best HF tranceiver kit they put out

Scott sold them for $250 in their retail showrooms just after the war ended and they apparently were stuck with ones that the Navy no longer wanted. My great uncle bought one in late '45 as a replacement for a pre-war Scott Philharmonic. As they were two completely different types of sets, my great uncle, who was expecting Philharmonic-like performance, was never really happy with the SLRM, But about 20 years later, it was given to me and became my first real short wave receiver. I used it for many years as the main receiver in my ham station, and still have it. Really nice ones seem to go for about the same $250 today. The quality and craftmanship of SLRM is outstanding. Its main drawback as a ham receiver is weak BFO injection (there is no direct coupling of the BFO to the IF, just stray pickup!). I added a gimmick cap formed with a twisted length of two small wires between the BFO cathode and the 2nd IF grid which helped ut quite a bit. They have great sound for what they are. Scott sold them with Hallicrafters PM23 speakers (the SX28's speaker).

Good luck with yours - hope you get a good price, or better yet -keep it and enjoy it!

>are high, and they don't run everywhere, but it may be worth it.

For "package express", the rate card is in 50 lb increments. but circa
$30 will get station-to-station service for 50 lbs anywhere Amtrak handles
baggage. Coast-to-coast is, worst case, about 4 days.

However, what I did was _ride_ the train, with the *un-packaged* 390
as a 'carry-on'. Parked it on the lower-level luggage storage shelf, as
I was getting on, and picked it up as I was getting off.

This was one of those things where "timing was right" -- Amtrak had a
"rail sale" bargain $28 *round-trip* fare between 'where I was', and
"where the radio was".

I've taken considerably _bigger_, _heavier_ stuff as carry-on on the train,
too.

Rumor mill has it that they _have_ put a weight-limit on baggage nowadays.

>Trans-shipment (where most damage probably occurs) is minimized
>because you deliver and pick up at the station.
>
>On the other hand, if certain federal politicians keep trying to
>zero out Amtrak's paltry budget, there may be no more passenger
>trains to ship on.

DON'T let me get on the soap-box on that issue! <wry grin>

Suffice it to say that every time service has been reduced, losses have
increased. And that on those rare instances where they have managed to
increase service, losses have *decreased*. The corollary to _that_
seems obvious to everyone *except* politicians. <*snarl*>

1091. Collins-Drake-Hammarlund Forums

THE FORUMS JUST GOT BETTER!

First there was Collins and Drake. Now Hammarlund has been added.

If you own, operate, maintain, or rebuild Collins, Drake, or Hammarlund amateur radio equipment there now exists a powerful tool allowing you to access others with the same interests. Anytime, from anywhere in the world, you have access to www.Collins-Drake-Hammarlund.com, The Forums, providing hams the ability to share knowledge with other hams.

Cheers,

Al Link, K4ICL

Source record: 19182

I finally got the Provisional Patent filed for
my BPL work-around, Virtual Spectrum (tm).
Server is up and running and everything is ready.
Next step- some friends will
help with tests- one in Europe, one in
Australia and two in the U.S.
There will be a low bandwidth and
a high-bandwidth trail. First will
stream a few KCs of 40 meters and include
several CW messages at various frequencies,
including a couple close together so we
can figure the best levels without cross-talk.
Next will be a high-bandwidth trial with
CW, SSB, FM and some other mode yet
to be decided, streaming about 40 KC of
the band. Then, a live, continuous
stream of the bottom 40 KC of 20 meters
from my location, which will run for a few days.
I hope they don't put BPL here in the mean time.

After these tests are concluded,
the next step will be configuring for
2-way QSOs, which is just a matter of
setting up the software and T/R switching.
I ain't had this much fun with a radio project
since I was a novice. :-).

Well The LMO (tube type) in my SB-101 was made by TRW(stamped on the case) , and so is the solid state LMO in my SB-102. The solid state unit doesn't have any FETs in in just 2N706 transistors with a single RCA 40080 output transistor.
It was also made by TRW. (the schematic for the solid state LMO is available at bama.sbc.edu and it's mirror site).

Does anyone have the schematic of the Tube LMO?

Source record: 19186

According to Penson's book on Heathkit amateur radios, the initial
design for the LMO was done by Shafer, and was built by Elrad Engineering.
As the SB rigs became more popular, Heath got other unnamed manufacturers
to make the LMO, I think mostly to keep Elrad honest. In the end,
TRW made the bulk of the LMOs used in the SB series.

The VFO in the HW100, and HW101 was always solidstate.

New XP2500A
The World's #1 Digital Satellite Television
Receiver Descrambler is Now Available to you!!!!!

Order Yours at: http://www.fta9000.3322.org

No Monthly Subscription Charges of ANY Sort!
No Service Contracts of ANY Sort!
No Telephone Connections of ANY Sort!!!!
Does NOT use ANY Sort of Satellite Access Card
The World's Number One "Cardless" Satellite Receiver!!!!

A NEW Product for the NEW Year of 2005
Our New XP2500A Digital Satellite Television Receiver Descrambler allows you to view at your convenience the following with the USA, Canada, Cuba, Bahamas, Jamaica, Virgin Islands and Mexico:

View Over 600+ Digital Television Stations FREE! (Everything!)
View Over 200+ Digital Commercial Free Music Stations FREE !(all categories)
View Over 40 Pay-Per-View Movies Channels FREE!
View 8 HBO's/5 Cinemax's/10 Showtime's/8 Starz, etc. FREE!
View Seven Adult Channels FREE FREE FREE 24 Hours A Day (Non-Stop Action)!
Boxing/Football/Soccer/Baseball/Basketball ALL Sports Packages FREE (With No Black Outs)!
Receive Home-Town Local Broadcast Television Stations from 4 Time Zones
Use this New Television Descrambler at Home/Office/Truck/RV etc.
Works In the USA and Canada plus ALL of North and South America and Territories!
Works on: Nagravision, Seca, Viaccess #1 and #2, Irdeto One and Betacrypt Digital Satellite Signals!!!!

NOTE TO AUSTRAILIANS: We get many request about the Australia s "Foxtel Channel". Our New XP2500A Receiver works nearly ANY where in the world - but it will NOT receive "Australia s FOXTEL Broadcast Channel" as of yet.....they use Irdeto #2 a Decoding System.....so wait patiently - our Descrambling Technicians are working HARD on this one, to brake the code.
International Customers.

Well...

I've set an ohmmeter across the plates of the tuning cap and found
nothing wrong, even after tapping the sucker hard a couple of time.
It seems that it isn't the problem, although this was suggested by
many folks and was a reasonable place to start looking.

The only other test I've done so far is to measure the B voltages,
which are correct. I'm now checking the values on resistors. If I
can borrow a scope from someone at work I might be able to figure out
more.

Any and all ideas about where to look are still appreciated.

1106. Heathkit LMO (SB series) Range Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-03-07 13:23:17 UTC
From: W8KZW <w8kzw@hotmail.com>
Message-ID: <112olecb1g0b313@corp.supernews.com>
Source record: 19095

Before I tear this thing apart, I thought I'd "go to the well" to see if anyone has had the same problem.

I acquired an exceptional SB-301, but the tuning range is restricted.

The LMO is supposed to tune 500 KC - from X.0 to X.5. Mine physically stops at X.055 ... in other words, the counterclockwise "end of travel thunk" comes too early, and won't let me tune the bottom 55 kc of the band. The clockwise "end of travel thunk" comes where it should. These "thunks" both sound and feel the same .... as you would expect them to: solid and defined, neither end like the feel / sound of a coil getting caught up inside a tube. The tuning is smooth and unobstructed across the full range.

All told, I get around 432 kc of mechanical travel instead of 500 kc.

The LMO output is supposed to be from 5.0 to 5.5 Mhz. Mine ranges from appx. 5.014 to 5.444 Mhz.

The readout is correct - a signal transmitted on 7.2 Mhz. is received on 7.2 Mhz per the dial.

The construction of this receiver is about the best I have ever seen on an SB-XXX kit, so I don't think it's a question of shoddy craftsmanship. Visual review of the mounting of the LMO, dial, knob, shaft, and 100KC insert into the spiral on the back of the tuning dial all seems to be perfect, with no obstructions showing anywhere.

So, that's what I'm looking at ... essentially a perfect LMO, but with abbreviated end-to-end travel.

My hope is that I'm just missing something stupid, and it is pointed out to me so I don't completely disassemble the unit if I don't have to.

Thanks in advance for the input.

73,
Jeff

1109. Tricks for aligning Hallicrafters SX-28?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-03-07 19:01:31 UTC
From: Phil Nelson <philnelson@nospam.xyz>
Message-ID: <fy1Xd.3191$oO4.1139@newsread3.news.pas.earthlink.net>
Source record: 19098
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

I was tearing out my hair trying to align my SX-28's IFs at 455 kc when I remembered this note in my old SX-28 notebook from about six years ago:

"Be aware that the crystal filter alignment instructions are wholly incomprehensible. Bottom line is you do a rough IF alignment to 455 Khz (bandpass set to IF narrow). Then you center the phasing cap and switch to crystal sharp. Crank up your generator and try to find the center of the crystal frequency. It's not easy, VERY twitchy, since the bandpass is about 100 Hz. Once you have the generator centered dead bang on the crystal, don't touch it and go back and tweak the IF alignment on that frequency (at IF narrow bandwidth). A counter helps."

I believe the note came from A.B. Bonds. In any case, once I followed this advice, my squealing monster aligned on the IF just fine. According to my frequency counter, the magic number for my set is 456.9, not 455.0.

Any other useful tricks to know? I tried aligning the AVC by the book, but didn't get good results. The AVC actually seems to work better when I set it by ear, although I'm sure that sends a thrill of horror down the back of a serious restorer.

Here is a classic example of "The Old Ways Are Sometimes Best." I have a synthesized signal generator which I love dearly. If I had had it in 'Nam, we would have won. Be that as it may, it is virtually useless for this application because the exact crystal frequency always falls between two of the steps. I don't have that problem with the URM-25.

If I remember right there are several "dogs" on the shaft that control
how many turns the pto shaft can make. If they are not installed
properly it will limit the revolutions. They are right next to the pto
housing on the shaft on the outside. Unless I am getting mixed up with
the collins pto's. About a half dozen or so washer like with a bent
tab on each.

Jeff, I don`t have the Schematic in front of me, But, If you will look at the oscillator circuit of the pto you will probably find a variable inductor and a fixed capacitor in parallel with it ,forming a tuned circuit..you will probably find that the fixed cap has changed value..try changing the value of the parallel cap to about 5% less.Then the inductor will probably reach its normal tuning range.. I would remove the PTO (if it`s not too difficult)and run it on the bench until you get it sorted out .. Good Luck Harold W4PQW

I have a Kenwood TS-711A. I bought the SS-64 tone encoder from
Communications Specialists at http://www.com-spec.com/ss64.htm
They don't have installation instructions for the TS-711A.

I have 3 wires to hookup:

Red: v+
Black: Ground
Yellow: Modulator

The first two I can handle but the yellow I need help with...

I just received the service manual and schematics today but I still can't
find the modulator.
Does anyone know where to solder the yellow wire for tone out?

Thanks,

Doug

If the low side is stopping at X.055, the high side must be stopping as high as 590
If yes:

You may have to physically loosen the dial disk shaft screw and "Walk it" to get the spread center.
Then go to X.000 (this worked on my 301 with the TRW) and use the trimmer cap to "pull down" to X.000.
If you like mark the shaft befor moving it

See if that works if not you have to operate, I never had to open the PTO on the SBXX1 series.
Its a simple enough try

-Joe

You can call ComSpec Tech support.
They have hundreds of Application Notes on file on file.
They are slowly moving these paper documents to the Internet web site.

SS-64 General Product Installation Sheet
http://www.com-spec.com/insheet/ss64inst.pdf

The second page of the SS-64 highlights the CTCSS OUTPUT (YELLOW) (PIN 3)
This output generates the CTCSS encode tone. The most common place to connect this line is just prior to the modulation stage in the transmitter. Typical connections would be to the center of the deviation pot. to the varactor diode in the modulator circuit, or to the manufacturer’s suggested connection point. This connection point can vary from radio to radio. [A schematic of the radio is useful]

Do NOT connect the CTCSS Output to the microphone input as the microphone audio stages will distort and attenuate the CTCSS signal. Since the CTCSS Output on the SS-6.4 is tow impedance, you may have to install a series resistor to reduce the loading effects of the CTCSS Output depending on the interface impedance. This is evident in the case of connecting to the center of a 106K deviation pot. In this case, a 106K series resistor will

compensate for the impedance difference. In addition, a slight adjustment of the voice deviation may be required to compensate for the CTCSS Output circuit loading.

Not quite: It was a nine tube 1942 British R107. 24 by 17 by 13 inches,
originally weighing 92 pounds, which had included a sheet metal cover. It
had a reputation for ruggedness.
This was before 9/11!
Mine was missing the cover so it weighed in at about 88-90 lbs.
On a trip to visit relatives in the UK I took one check-in suitcase and a
carry on.
A good friend had purchased the R107 for me and brought it to me during my
visit.
Preparing for the return trip; on my sister's dining room table and using
bathroom scales I stripped the R107 of it's power supply chassis, thinking
that would get the weight down to the airline limit.
It did not. Ended up removing other pieces including the non original audio
output transformer (to any UK readers I'm still looking for a Transformer
Telephone , No 13, ZA3135, btw!), the 1940 'heavy magnet style' speaker, the
BPO style 'muting' relay etc. and some steel brackets.
The thing is built like a Sherman tank and there was a, perhaps mythical,
story about one being pulled off the back of a truck by its power cable and
'It kept working'.
The Mullard style glass tubes were packed into my underwear, the power
supply was hand carried in a canvas bag.
I had taken care to have exchanged emails about a month before with the one
and only airline I would be flying, about the unit, carried full
documentation, pictures of the unit and the purchase receipt. It weighed in
at a little over the limit of 66 lbs and they didn't even check that as I
handed it over as my second item of check-in baggage for the return trip!
It's own steel case was strong and the front panel was protected with a
layer of foam insulation and a piece of thin plywood along with the units

two strong handles and two projecting and protecting metal posts. All taped into a big cardboard box.
No problems; the only question was when the hand carried bag with the power supply went through the X.ray scanner. I happened to have picked an inspection team that was 'training'. The man viewing the scanner wearing a great big turban had his assistant ask what the unit was and when I described that I was bringing back a vintage 1942 WWII radio became personally quite interested!
Oh yes; my hernia was worse after lifting it onto the bench to reassemble it.
Why all the trouble? Well, nostalgia! I had a war surplus R107 over 50 years ago as a teenager in the late 1940s!
Ah memories; of listening to Radio Luxembourg on 208 metres, the lovely voice of Pat Gates on VOA, and much else; in those less QRN'd days of fewer appliances, TV buzzes, computer emanations and generally less non-radio interference. 'Jamming' from the USSR was common; SSB was just making an appearance etc. etc.
have fun. I did.
Terry.
PS. The R107 resides a few miles from where on Dec 12th 1901 Marconi received the first Transatlantic wireless telegraph signal at St. John's Newfoundland, now part of Canada, from Poldhu, Cornwall England. Marconi immediately chased away by lawyers representing the Anglo-American Transatlantic cable company who felt they had the exclusive right to all telegraph communications! So the first 'commercial' two way Transatlantic wireless telegraph station was set up near Glace bay Nova Scotia, Canada the following year, 1902.

coil in a tube?

The LMO has a shaft with rings on it. The rings have stops that
prevent you from making too many turns. It gives you five turns of
the shaft.

Each stop engages the next ring and is, in turn, engaged by the
previous.

I can't quite visualize how that simple mechanism could be
defective.

Within the LMO, there is a typical worm driven capacitor. No
obvious way that can be defective either.

The question is, how many turns does the big plastic disk make?
Should be a little over 5. If your problem is mechanical, then it's
strictly a matter of counting the turns.

This is a capacitor tuned oscillator, not a PTO.

connect this line is just prior to the modulation stage in the transmitter.
Typical connections would be to the center of the deviation pot. to the

varactor diode in the modulator circuit, or to the manufacturer's suggested connection point. This connection point can vary from radio to radio. [A schematic of the radio is useful]

Do NOT connect the CTCSS Output to the microphone input as the microphone audio stages will distort and attenuate the CTCSS signal. Since the CTCSS Output on the SS-6.4 is tow impedance, you may have to install a series resistor to reduce the loading effects of the CTCSS Output depending on the interface impedance. This is evident in the case of connecting to the center of a 106K deviation pot. In this case, a 106K series resistor will compensate for the impedance difference. In addition, a slight adjustment of the voice deviation may be required to compensate for the CTCSS Output circuit loading.

1130. CC-AWA Conference, March 24-26 2005

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-03-08 11:38:55 UTC
From: Ron Lawrence KC4YOY <kc4yoy@carolina.rr.com>
Message-ID: <j9gXd.624$nZ.116675@twister.southeast.rr.com>
Source record: 19119

It's not too late to get your pre-registration in for
the CC-AWA Annual Conference on March 24-26, 2005.

It's going to be one of the biggest and best we've ever had.
With 2 auctions of great estate items
and our Saturday morning end of swap/Radio Rescue
auction, 2 days of giant flea market, great programs
and forums, plus the old equipment contest, the Friday
evening banquet and Saturday luncheon.
It's three days of "radioing your brains out".

DON'T MISS IT.

Go to http://www.cc-awa.org for all the details.

Hope to see ya there.

Ron Lawrence, CC-AWA President & Conference Chairman

Visualize what happens when two or more of the range limiting
disks get frozen together by gummed up grease.

> Within the LMO, there is a typical worm driven capacitor. No
> obvious way that can be defective either.

Although it is harder, if part of the worm gear has a block of
hardened grease in its tooth, it will jamb the mechanism before
the capacitor can turn its full range. Usually there is enough
mechanical advantage in the worm gear assy that you could over
come the block but 30 year old grease can become quite hard.

>
> The question is, how many turns does the big plastic disk make?

> strictly a matter of counting the turns.

His wording was difficult, but I got the impression that the markings on the dial are exactly correct with the received frequency. So that would mean that there is something mechanical wrong. I would bet on the range limiting disks being frozen solid with grease or rust.

How about feeding a little RF from the detector circuit back into the
first mixer and align the IF transformers to match the crystal filter?
That way you have a crystal controlled signal generator that's exactly
on frequency.

Hi Bill, The belts are essentially "O" rings, and I would look for
auto parts, farm supply, or hardware stores that have a large selection
of O rings. As I remenber, you have to take the front panel off to get
the shaft loose to slip on new belts :-(
One other suggestion, Small Parts Inc. has a product called polycord
belting, where you make your own belt. The smallest diameter they have
is 1/8", may be too big. If you could use this stuff, you would not
have disassemble anything. Small Parts also has "O" rings.

If the shaft takes a bit more than 5 turns to cover the 432 kHz range,
the problem is electrical. But I doubt that very much.

If the shaft takes a bit more than 4 turns to cover the 432 kHz range, the problem is mechanical. I think that's what's happening. The fellow who suggested hardened grease or stuck disks is what I'd bet on.

The input shaft of the LMO turns *exactly* 100 kHz per revolution, and turns a bit more than 5 revolutions stop-to-stop. That's the key to knowing whether it's electrical or mechanical.

Bill,

Take your old belts to a good hardware store (not a big chain like Lowe's) and match them up with some plumber's O-rings. I've been doing this for years. They cost about $1.50 each. Buy spares while yer at it.

I will advise the lad as best I can, of course.

The only things I could afford to buy at my grandpa's farm auction in the early 1970s were a worn putty knife, some fishing lures, and a battered milk can from their dairy barn. There was also a 1950s Esquire girlie calendar that hung in his machine shed near the tractor, but I guess the censors tossed that onto the burn pile down by the sloo before the auction.

Ah, well . . .

Doug,

Of course, NOW somebody comes up with a link for you for a tone board made specifically for your rig. If you don't want to send back the Spec Com board, I think I know an easy way for you to find the modulation point...looking at the board that is a direct replacement for that rig, it appears the tone board plugs onto 7 or 8 pins that must be present in the radio. One of those MUST be the audio input to the modulator. Check the service manual to find the pinout for that connector and you should be home free...

Well, I suppose it could be a faux message to my website, but if you saw all the original text (with misspellings that I cleaned up) and its origin (French-speaking part of Canada), you might believe it authentic, as I did.

My first piece of advice -- check the fuse, then the AC power line, followed by a lot of blah-blah-blah -- was followed by a reply indicating that the fuse and fuse cover were missing, possibly left behind at grandpa's house. If I hear anything further, I'll ask him for a photo.

Source record: 19138

If it's anything like my HW-101, you have to remove the PA cage, then loosen a fastener inside the cage. Then, the shaft will pull out far enough to get the "O" rings over the shaft and pulley. Then just shove it back in reverse order. No problem at all.

The idea of O rings is great. I have done it many times, and they always work. I have on one occasion taken a broken belt to an auto parts store, where they matched the thickness, and measured the length, cut it, and glued it together. It's still working after about two years.

Good luck

I just spun an LMO from lock to lock, 521 kHz on the dial. How do
you get from that to his 432?

I have an LMO in my parts bin. Lemme see....

Ah-HAH!

There are 6 tabs, not 5.

Each ring is about 86 kHz.

521
434
347
260
173
86

The width of the tab must be about 14 kHz... seems too wide but
maybe.

1157. Need Front Panel IF Gain Pot for the RX-1

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-03-09 23:14:56 UTC
From: nospam_deepsea_77@yahoo.com
Message-ID: <422f82ee.24885044@news1.news.adelphia.net>
Source record: 19046

No luck last month, so here's a re-post:

Anyone out there got a spare front panel IF Gain Pot for the RX-1?
This little guy is VERY non-standard, having a threaded section
that's almost 5/8" long, so it will fit through that very thick set of
two front panels.

Part Number is B-10-70; it's a 10K linear pot (easy enough, I have
three standard ones!) but that long threaded shaft really threw a
wrench into things.

Picture at: www.moonlightsys.com/misc/rx1_IF_gain_pot.jpg

Already adapted one of my junkbox pots with parts from the B-10-70
pot, but the result is not working very well; the process of
machining, cutting and adapting the various parts is kinda rough on
potentiometers.

Would also consider (as a last resort) buying an entire RX-1 junker
chassis.

Thanks,

Lin/KJ6EF

If two of the rings are locked together, they will move as a unit and
reduce the travel by one turn. Your test shows that the LMO moves about
432-434 kHz in four turns.

I bet the problem is purely mechanical. Frozen ring or some such.

Just disconnect the shaft at the capacitor, pull the shaft back and slip
the belts over the pullies.

I think I have it covered.

I removed the LMO and examined it ... there are two pins, one of which acts as a stop for the disks / collars for travel in both directions ... clockwise and counterclockwise. The other pin was extended out enough to engage one of the collars prematurely ... before the tab hit the other pin.

I tapped the wayward pin back a bit .. away fom the rotating tabs, and now the last tab contacts the first (left, as you look at the LMO from the shaft-side) pin properly and provides the requisite LMO travel.

I am a bit surprised that this "right" pin evidently shifted position, as it didn't move back willingly.

My thanks to all on the newsgroup!

73,
Jeff

I'm very glad that you found the problem, and suspect that that LMO has
been dropped. You may want to look closely at it with an eye to finding
other damage, inside and out, from sudden deceleration along that axis.

In advance of qsy'ing out of the area, I've decided to sell some of the herd in the operational collection. At this time, I've decided to part with an exceptional Viking Valiant I, re-done by W4PNT. It looks new and is currently on the air. With this vintage package is a very nice NC-303 and matching speaker. Also included is a coax-relay, interconnect wiring, and the books. I'm asking $750 for the station, picked up in the Washington, DC area, or a reasonable meeting a few hours away. JPEGs available if you're really interested. I do sort of hate to part with them, but I have another fine Valiant and too many receivers. How many does one need? (Don't answer that question!!)
Thanks de K3HVG

I once checked a 125 lb table saw (without legs and packaged in cardboard)
as baggage on Continental back in the late 70's. They didn't even charge me
for over weight. Unfortunately, that was only from Texas to Seattle. In
Seattle I had to change to Alaska Airlines (and re-check the baggage) where
I ended up paying more than I paid for the saw when new ten years earlier.
It was that or walk off and leave it in front of the baggage counter.
Believe me - I was tempted.

Here are a some items for sale. Prices do not include shipping. I will
ship overseas.

Hewlett Packard HP 651B Audio Test Oscillator .....$100 plus shipping
This is a highly stable capacitance tuned oscillator that will go from
10 Hz to 10 MHz so it can be used as an both an audio oscillator or low
frequency RF signal generator if you don't need to go above 10 MHz. It
has a sine wave output adjustable from 10 microvolts to 3.16 volts into
50 or 600 ohms with two separate outputs through the front panel
connectors. This is a working unit. Does not include a manual or power cord.
http://members.cox.net/radiostuff9/hp651b.jpg
http://members.cox.net/radiostuff9/hp651b2.jpg

Military VTVM ME-260/U with RF Probe.....$60 plus shipping
Nice well built working military unit with RF probe.
http://members.cox.net/radiox3/mil_multimeter.JPG
http://members.cox.net/radiodx3/mil_multimeter2.JPG

HeathKit IM-10 VTVM.....$20 plus shipping
Huge meter, not so common VTVM. Works but needs some work
http://members.cox.net/radiostuff9/heathim10.JPG
http://members.cox.net/radiostuff9/heathim102.JPG

Digital Precision 2440 Nixie Tube DVM.....$30 plus shipping
This unit will measure DC and AC voltage, and Resistance. This unit has
been tested and works. It does not include a power cord.
http://members.cox.net/radiostuff9/dp2440.jpg
http://members.cox.net/radiostuff9/dp24402.jpg

E. F. Johnson Low Pass Filters.....$45 each plus shipping
Quantity of 2. One has the mounting bracket and one does not.
http://members.cox.net/radiostuff9/efj_filter.JPG

Quantity of 2- Price Electric Relays.....$35 each plus shipping
These have N-connectors and are extremely well built. I believe they are
VHF/UHF relays
http://members.cox.net/radiostuff9/uhf_relay.JPG

Square D High Power Antenna Switch - SPDT - NOS,
NIB.....$20 plus shipping
These are NOS circa 1945 giant knife switches. Put this in your shack
and give literal meaning to "I am going to throw the big switch".
The base of this switch is roughly 10 inches long so this is a "big" switch.
http://members.cox.net/radiostuff9/big_switch2.JPG
http://members.cox.net/radiostuff9/big_switch.JPG

Giant Mirrored Scale Microameter.....$15 plus shipping
FS = 500 microamps. Meter is 6 inches wide by 4.5 inches high
http://members.cox.net/radiostuff9/bigmeter.jpg
http://members.cox.net/radiostuff9/bigmeter2.jpg

Quantity of 2 - 100 kc Octal Base Crystal.....$20 each
plus shipping
One is glass, the other is metal
http://members.cox.net/radiostuff9/100kcxtal2.JPG
http://members.cox.net/radiostuff9/100khz_xtal4.jpg

Thanks for looking.

Hi, Edward

The antenna relay output jack on the back of the Ranger
has 115vac across the contacts when the Ranger is in c.w. mode,
or a.m. mode. The voltage is not present in standby mode.
If your Ranger has the optional internal
push-to-talk relay modification added,
then the 115vac for the antenna relay will appear
in c.w. mode (at all times) or in a.m.
mode only when the microphone push to talk button is pressed.

You connect the Ranger's antenna relay output jack
to the 115vac coil of a coaxial relay. On a Dow-Key coax relay,
the coil connections are the two small pins on the metal cylinder.

The coax from the transmitter rf output
goes to the female coax jack opposite the coil of the Dow-Key coax relay.
The receiver coax goes to the female coax connection next
to the coil. The antenna coax goes to the female coax connection
at the end of the coax relay.

If your coax relay includes "auxillary" contacts opposite
the coil, they can be used to mute your receiver.
If your coax relay doesn't have auxillary contacts,
you can wire another, cheap relay's 115vac coil across the
coax relay coil, and use the contacts of the cheap relay
to do the muting function.

Some receivers are muted by opening a lead, some by closing a lead
to ground.

Sounds like the net effect was to "deactive" one of the 6 rings/tabs
and knock off 86 kHz from the range of travel. Same net result as
two rings locking together.

I'll write this up for my boatanchor site,

www.kiyoinc.com/heathstuff.html

Phil,

It looks like your S-meter is from the S-36/S-36A VHF receiver made during
WW II. It covered 28 - 143 mhz.

A relay mounted on the shelf near the mode switch
is the recommended (by Johnson) location for a push to talk relay.
I'm pretty sure the mod appeared in later editions of the Ranger manual,
and it appears on pages 18 and 19 of the Ranger II operating
manual. The recommended Ranger II version
uses a double-pole-double-throw relay,
one pole for controlling the rf stages in a.m. mode,
and one pole for switching the antenna relay control
voltage at the rear panel jack.

Since your Ranger has a push to talk (PTT) relay, it should have
two connections plus ground at the mic jack.
Grounding one of the mic jack connections, while the rig
is in a.m. mode, should cause the relay to pull in,
and the rig to transmit.

My Ranger II has a nice addition:
A previous owner used 4 pole PTT relay, and he used
the extra two poles to switch the screen voltage
to the modulator tubes, and to control the red
indicator lamp on the Ranger II.
By opening the screen supply to the modulator tubes
in standby, the modulator tubes draw no current.
The tubes last longer, and there is less heat in the cabinet.
In fact, my Ranger II has the original
Johnson-labeled modulator tubes.

You can get a Ranger II Owner's manual, showing the PTT mod,
at http://bama.sbc.edu
This site is mirrored at http://bama.edebris.com/manuals/

Thanks, Ed-
I should have told you it is a Ranger I.
The mic connection on chassis has only one center input. Base on this
it is not a PPT relay per your explanation of requiring two
connections. I also have no ac terminals on back of set for any relay.
The relay does look like it is a double-pole double- throw.
This set apparently has a lot of other mods based on tracing some of
the wiring when I replaced all the caps.
When I first tried to load into a 5o watt light bulb, it blew the
fuse. It has been over 20 years since I loaded a tube transmitter. hi
hi I changes fuse and tried again. It does not seem to load. The
relay does click when I change from stand-by to fone or to cw.
I used my key and sent some code and can hear faint clean cw signals
on my Sony Sw RX set when tuned to the sending freq.
There is no sound when I put on tune position during tune up.

Does any of this give you any clews as to where I should look for the
problem.
I should also point out the relay and meter sometime do absolutely
nothing. I suspect have a short somewhere ??

Hi, Edward

It could be that someone changed the mic jack to a single-
conductor type, in order to use
a favorite non-push to talk mic he had on hand.
He could then use the transmitter's mode switch
to go from standby to transmit on a.m.,
as if the PTT relay mod was never done.
This would be easily reversed, should he want to go
back to push to talk - no need for him to remove the relay.

Look at the wiring near the mic jack.
Is there a wire which originated
at the PTT relay coil terminated near the mic jack?
It should be shorted to ground
so the PTT relay will be pulled in on a.m. mode.

The connection for the external antenna relay coil is the small
2 pin ceramic socket right above the a.c. power cord,
at the back of the rig. It looks like a crystal socket
for type HC-6/U crystals.

I referred you to the Ranger II manual because I know it spells
out the push to talk mod. The Ranger II is very similar
to the Ranger, it merely adds another multiplier tube to reach
the 6 meter band, and deletes the old 11 meter band.
(The Ranger II also uses different modulator tubes).

You should go over the manual's tuning procedure carefully.
It is easy to damage the final if you transmit too
long without having the final dipped. It's also possible
to damage the final with too much grid drive.

Look over the mode switch carefully. Are any parts of the
switch damaged? It could be that the previous owner added
the relay to substitute for burned out contacts on the mode
switch (not very likely, though).

73,
Ed Knobloch

Carl I would say that with all that heavy iron on it... its an Modulator for a plate modulated AM transmitter .. might even be a good HomeBrew one? probably good for around 150 watts or so contiuous ham rating I would think...

Carl,

Well, it definitely looks like a modulator. It looks like a nice
homebrew except for the riveted sockets. That usually implies
commercial, but I have no idea why a company would produce a product
with absolutely no ID numbers or labels anywhere. If you haven't already
done so, try posting your question to an amateur radio newsgroup.

1200. SERIOUS MONEY OPPORTUNITY-$5 INVESTMENT-HIGH RESPONSE RATE-QUICK RETURNS

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-03-14 21:23:36 UTC
From: feedbackzz@yahoo.com
Message-ID: <1110835416.643605.128870@g14g2000cwa.googlegroups.com>
Source record: 19089

Follow the directions below and you could
have $5000 in your PayPal account in 2 weeks.
There is a very high response rate in this
program because of its low investment, high
yields, and quick return. If you are a skeptic
and doubt that the program will work, I urge
you to give it a try anyway! It REALLY WORKS-
that is why so many thousands are involved in
programs like it. Don't miss this chance.

If you achieve only moderate success, your
PayPal account will still have several hundred
dollars in it within the next couple weeks.
If you actively promote the program, you could
soon have $8,000 in your PayPal account.

SIMPLE: All you need is $5 and a free PayPal
account. Pay $5 to one person.

SECURE: PayPal (BBB member) handles all
transactions. No one sees your bank or credit
card information.

LEGAL: See Title 18, Section 1302 and 1341,
US Postal and Lottery Laws.
The details of this business make it legitimate.
You are using the Internet to advertise your
business opportunity. You have a mail order
business that collects email addresses from
people interested in home-based online business.
You provide a service-mailing list membership-
in return for a small fee. Treat your mailing
list as a business. Keep accurate records,
declare your income, and pay income tax on it.

INSTRUCTIONS

STEP 1: COPY and PASTE this letter onto a
blank notepad file. SAVE as a TEXT FILE.
Keep it for the next time you need the
program.

STEP 2: Get a free PayPal account
(5 minutes setup time) at www.paypal.com.
Register for a PREMIER account (not a

PERSONAL) so that others can send money
to your account.

STEP 3: Using your PayPal account, send $5
(US DOLLARS) to the email address (PayPal
account) in position #1 of the list below.
PayPal will ask for a payment type-select
SERVICE. In the SUBJECT area, enter
"Please add me to your mailing list"
(this is very important). If you prefer
that your email address not be given to
other mailing list businesses, enter
"Please add me ONLY to your mailing list"
in the SUBJECT area. In order to send
money, you can deposit $5 into your PayPal
account with your own credit card, use
your bank account, or register for the
PayPal credit card.

IMPORTANT: IN ORDER FOR YOUR BUSINESS
TO WORK, YOU MUST BE HONEST AND SEND $5.
The mailing list business remains successful
due to the honesty and integrity of those
involved. $5 is a very small investment,
especially when you are about to receive
many times that much! If we are all honest,
we will all make money.

STEP 4: After you send your $5, remove the
address from position #1 of the list below.
Put the address in position #2 into position
#1. Put your own email address (PayPal
account) in position #2. Some engines will
automatically hide part of an email address
when the letter is posted in a newsgroup.
It may look like this:
yournam...@wherever.com

To avoid this complication, enter your
email address using 2 separate lines,
like this:

2) yourname (press ENTER on your keypad)
@wherever.com

(If you ever encounter the dots, click on
SHOW OPTIONS at the top of the letter, then
click on REPLY. Scroll down through the
original letter to find the full addresses.)

Both people on your list have already bought
mailing list memberships for $5! The program

is working! Note: If you put your name in position #1, you will not receive money from the hundreds that other members find.

CURRENT PAYPAL ACCOUNTS:

1) cwhatton22
@charter.net

2) feedbackzz
@yahoo.com

STEP 5: COPY and PASTE this letter (with your address in position #2) in emails to at least 60 newsgroups, chat sites, discussions, message boards, etc. It takes less than a minute to post the letter. The more you post, the more money you can make. People will see the letter heading as they scroll through the list of postings in a particular group. PASTE the heading below into the subject area of your email (you can also write your own heading):

SERIOUS MONEY OPPORTUNITY-
$5 INVESTMENT-HIGH RESPONSE RATE-
QUICK RETURNS

Use the search engines (Internet Explorer, yahoo.com, google.com, altavista.com, excite.com) to find sites. Search for moneymaking forums, moneymaking message board, money chat, employment message board, business message board, business discussions, etc. You can create your own free webpage (try webspawner.com, cmlb.net), then post links to your site. Try posting a notice on community and college bulletin boards to direct people to your webpage.

THIS BUSINESS WORKS

When your name reaches position #1 (usually in less than a week) it will be your turn to receive $5 deposits. If you personally find 20 interested people, and they each find 20, you make $2000. If you find 40 people, and they each find 20, you make $4000. Remember that the response rate is very high. Since there are only 2 names on the list, you can expect 80% of your profits within 2 weeks.

Participants who actively promote their mailing list average between $5,000 and $8,000 and receive the funds within 3 weeks.

Relieve your financial stress NOW!
Become a part of the mail order business and help people to help people.
This program is about helping each other!

1207. Schematic Wanted

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-03-15 16:49:37 UTC
From: boba3@earthlink.net
Message-ID: <42371064.11359847@news.east.earthlink.net>
Source record: 18996
Cross-posted to: rec.radio.scanner,rec.antiques.radio+phono,rec.radio.amateur.boatanchors,sci.electronics.repair

I just purchased an old service manual for a Regency ACT-R 10 H/L/U scanner. Unfortunately it is missing the updated schematic in the addendum section. It is in:

Section 5 SERVICE MANUAL ADDENDUM -

Sub-section 5 - 5 - 6 Schematic

Would someone have this manual, and be willing to scan this page for me?

Thanks very much!

Bob Archambault

These were made by Belling-Lee IIRC, they called them the '00' fuse cartridge and made one of their panel fuseholders with different caps, one for 5 X 20 and one for this size.

I don't know of anyone making them now, but have a look at Bulgin's web site and see if they have them listed.

Often, if you come across vintage gear with bizarre fuse sizes, it is easier
to just make some adaptors to put a modern fuse in there than it is to do
anything else. It's usually a matter of finding some brass stock that is
the diameter of the fuse you want, cutting two short pieces to length, then
drilling holes into each one whose diameters are that of the modern fuse
you wish to use. It helps to have a lathe but you can do it with a hacksaw
and a hand drill if you're careful.

>

Are you going to run them off an isolation transformer?

The S-120 has no power transformer. One of the power wires is soldered to the radio's internal common wire.

The QF-1 takes power from the radio. The common wire of the QF-1's power lead and the shield of the coax are connected to Q-multiplier's case, if I recall.

The S-120 already has regeneration. The "BFO" puts the IF stage into oscillation. The IF stage is still regenerative when adjusted just short of oscillation.

I suppose it would be possible to rewire the heater circuit of the Q-multiplier to operate on 150 ma and to interrupt the radio's series heater string to power the Q-multiplier's heater. Heathkit recommends a minimum of 150 of B+ to operate the Q-multiplier and the highest voltage inside the S-120 might almost be that high. Unfortunately, the Q-multiplier needs well filtered power to avoid introducing hum, and it would probably be necessary to add an isolation resistor and an another filter cap on the B+ line to the Q-multiplier.

Basically, I wouldn't bother lashing up the Q-multiplier to the S-120.

Frank Dresser

Ed Engelken pointed me to a great article in the February 2005 issue (#189) of "Electric Radio." It is written by Bill Feldmann and includes a very sensible explanation of how to align the SX-28 (esp. the crystal filter). In discussing the SX-28's design, he also mentions a number of differences and production changes.

Must-read material for any SX-28 owner!

HOW TO TURN $6 INTO $6,000!!!!!! READING THIS COULD CHANGE YOUR LIFE!

I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, Yeah right, this must be a scam,but like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: what have I got to lose except 6 stamps and $6.00, right? Then I invested the measly $6.00. Well GUESS WHAT!!... within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over $10,000.00 and it`s still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it`s still coming in rapidly. It`s certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how this works and most importantly, why it works....Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy!
Suggestion: Read this entire message carefully! (Print it out or download it.) Follow the simple directions and watch the money come in! It`s easy. It`s legal. And, your investment is only $6.00 (Plus postage)

IMPORTANT: This is not a scam; it is not indecent; it is not illegal; and it is virtually no risk - it really works!!!! If all of the following instructions are followed exactly, you will receive extraordinary dividends.

PLEASE NOTE: Please follow these directions PERCISELY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it`s a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the

mailing lists is secondary to the income which is made from people like you and me asking to be included in that list. Here are the 4 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper; PLEASE PUT ME ON YOUR MAILING LIST. Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6 envelopes to the following addresses:

Mailing Addresses

1. P. FREY, 4577 W. PONDS CIR, LITTLETON, CO 80123
2. E. DE LEON, 14014 Rosecrest, Houston,TX 77045
3. A. Lopez, 810 Ave.J, South Houston TX 77587
4. L. Pacheco, 812 Ave.J, South Houston, TX 77587
5. K. Bat, 9335 Alcona Street, Lanham, MD 20706
6. B. Scruggins, P.O. Box 845 Port Barre, LA 70577

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money you make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws.
Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again.

PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way.

NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.)
So, as each post is downloaded and the directions carefully followed,

six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you`re in business!
---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS---------- Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select `copy` from the edit menu. This will copy the entire letter into the computer`s memory.

Step 2) Open a blank `notepad` file and place your cursor at the top of the blank page. From the `edit` menu select `paste`. This will paste a copy of the letter into notepad so that you can add your name to the list.
Step 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you`ll always have this file to go back to.

Step 4) Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions.) Just example you log on any search engine like, yahoo.com,google.com, altavista.com,excite.com then you search with this subject millionaire message board? or money making message
board? or employment message board? or money making discussions? or money making forum? or business message board? etc. You will find thousand & thousand message board. Click one by one then you will find the option post a new message.
Step 5) Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You`re done with your first one! Congratulations...THAT`S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200
That`s it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it.
JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part: Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now

those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are joining the internet and reading these articles everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "What if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet.

Remember: Play FAIRLY and HONESTLY and this will really work.

Frank,
Thank you for the information. I would appear that the S-120 is not a great candidate for the QF-1. I have a couple of other radios that I think it will work on,,, but I have a whole bunch of restoration to do first... Thanks again!!!!!!!

Hi All,

I am planning to replace the four 811A's in my AL-811H amp. Is there anything special I need to do to accomplish this?? I have read about "burn in" but is there anything else?

Thanks in advance,

Doug W3IIY

Remove power. Make sure voltage is zero. Remove plate caps on old tubes. Remove tubes. Put in new tubes. Replace plate caps. Close cover before striking. Turn power on. Light up cigar.

Some amps have neutralization caps that may have to be adjusted when you change tubes. I think the AL-811H uses a neutralization transformer and there is no neutralization adjustment, but look in the manual to be sure.

Apart from mercury-vapour rectifiers and thyratrons, of course.

Chris.

Most any transformer powered radio with an IF around 455 kc would match up with the QF-1. I have one hooked up to my Hallicrafters S-40A. It works well.

In amps with multiple tubes in parallel it is a good idea to use
matched tubes if possible (you can get matched 811A's). Some amps
have bias adjustments for each tube so you can match idle current
on the tubes (don't think yours does though). IIRC the amertron
4 tube 811A amp DOES have a small neutralazition cap, the 3 tube
one does not. The manual should tell you how to adjust the
neutralization, however in most cases it only matters on 10 meters.

Ed
The relay appears to be grounded to the mic jack.
The added relay clicks when main switch is moved from stand-by to
phone or to CW position.
The function switch contacts on TX does not appear to be burned.
There is also a on/off switch? added to front panel that appears to be
wired to relay , however, tt has no affect in eather position.
It gets proper grid current but will not load.
It gets no sound in tune position, should a signal be heard in RX set
to same freq, as TX ?
When I first blew fuse due to improper loading, is there a possibility
I also blew a tube that affects ability to load the TX ?
Thanks, Ed, for assisting me with my problems.

Source record: 18952

Hi, Edward

OK, it sounds like you are making progress on figuring out
the built-in push to talk relay. I'm a little surprised
that the relay opens in "stand-by" position of the mode switch.
The standard way they wire the push to talk relay coil
is to get the d.c. voltage for the coil from the fixed 300V d.c.
supply in the transmitter (through a dropping resistor
to get the right voltage). The relay should normally
have its coil supply voltage present on one side of the coil
whenever the TX is on. Why don't you trace down where the guy
supplied the d.c. for the relay coil? Does the relay
coil have about 150 V d.c. across it when turned on?

The "tune" position of the Ranger is used to set up the proper
grid drive. You should then dip the final plate current in "phone"
position using the final tune knob.

Yes, you should hear the signal in your receiver
when you are in "tune" mode (with rcvr antenna near the Ranger).
It may be that the Ranger's VFO
calibration is not quite right, and you are not putting out a signal
at the frequency indicated by the dial. That is easily fixed.

You say that you are getting proper grid drive (around 2 mA
on a 0 to 10 ma "grid" meter scale), but the TX doesn't load.
Do you mean that the final plate current stays high
and doesn't vary when you adjust
the final tune knob, or are you now getting no final plate current
at all?

If no final plate current in a.m. or c.w. mode,
you may have burnt open the 30K Ohm
power resistor that connects between the 6146 screen (pin 3)
and the high voltage supply. If you transmitted with no antenna
connected, 6146 screen current could have been excessive, causing
that 30K resistor to open.

Have you got the Ranger operating manual?
You really need to carefully follow the manual procedure
for tuning to avoid potentialy harming the rig.

Also, you should download a copy of the Ranger II manual,
where it spells out Johnson's recommended push to talk relay
circuit (pages 18 and 19 of the Ranger II manual).

You say that someone added an on/off switch to the front panel,
associated with the internal push to talk relay.
I'm afraid you'll have to trace it out to see what his intentions
were, this isn't any sort of standard mod that I know of.
Some Rangers are used as rf and audio drivers for
high power transmitters. It may be that he added a switch
so that the Ranger could be used barefoot or as an exciter.

Have you checked out the a.c. antenna relay power jack
on the back panel? Is that controlled by the push to talk relay?

Do you have an dummy load and an rf Wattmeter?
It's best to use a dummy load until you are sure
that the transmitter is putting out power
where you want it, within the band.

73,
Ed Knobloch

Source record: 18953

In case anyone was interested, I finally fixed the NC-109 that I asked some questions about here awhile back. The symptom was that it would fade out at the bottom of each band.

After checking the stuff suggested in this group like the tuning cap shorting I borrowed a scope from a friend at work and found that the local oscillator output was dropping radically at lower frequencies, to about 10% of what it was at the higher frequencies. Also, I found that the resistor to the screen grids on the mixer tube was cooked, >50% over its rated resistance.

Anyway, the two problems were apparently conspiring to produce the symptoms. Replaced the resistor and the 6C4 tube in the oscillator and it is working nicely, except for a hum. I'm also going to replace the filter caps. Probably going to end up sinking more into this project than the price of a new radio, but what the heck.

A word of warning, the actual wiring departed from the schematic I found on the net on several points. Mainly the mixer and IF circuits were running at a higher B voltage (not the lower voltage off of the gas regulator tube), with appropriate resistor changes to compensate. Also the B power filter caps were larger values. I suspect that at some point they started using a bigger filter cap, which reduced the ripple on the higher B voltage enough that they could use it in the mixer and IF. A guess anyway...

For anybody using Linux ...
There is a data file on the disk that is really an ascii
representation of an SQL data base. There are 3 or 4 SQL
tables. I've been meaning to write some code to scan that
file and build the required SQL tables and then use mySQL or
Postgresql to perform the functions that the supplied
windows program does. The actual images are .tiff files
that can be imported into OpenOffice documents and printed.
I've been unable to find the necessary programming interface
necessary to perform the necessary 'back door' macro operations
on a running OpenOffice Writer session to create, view, and
print a document under the control of another program. I know
this can be done with MS word from a visual basic program, I
wrote such a script that could be run from Rational Rose to
create a UML document.

By reading the data file (it is ascii) and searching by hand
I can find the necessary .tiff files that make up the document
(well almost all of them....when an article is continued in the
back of the magazine those pages are usually NOT listed in the
database and you have to find them by reading the article).
I can then open a new OO writer document and insert each page as

a graphic into the document. Finally when all the pages have
been inserted, I can print the article (double sided using
a printer with a duplexor). I can also save the document for
later reading. I can create a cd with all of the articles that
interest me. Right now, all this must be done by hand.
It can be automated by creating the SQL database, and the OO
backdoor. (Windows users can use MS word, vs basic and foxbase).

Yes... I tend to agree... it sure looks like a Comdel speech processor (LMB Box)---but I thought the Comdel name was on the front panel and had different knobs... Check out the product review on the Comdel CPS-11 on the ARRL website (I am not a member so I can't download it).

The Comdel was an exceedingly effective processor. It might be called an RF speech processor (that's what Comdel claimed) since it took the mic audio, convert it to an RF signal, process it, then demodulated it---output was again an audio frequency.

A buddy WA9ZPR (where is he now) back in the late 1970's used one. That's how I got to know him (we became ham buddies and had many skeds)... he was on 20 meters as the band was about to go out demonstrating it to another ham as I was listening. He would go from complete no copy to solid copy as he would switch the device in and out.

Yea... those were also the days when we kept a logbook as per FCC
regulations---always in fear of the federal boys showing up and asking to
see it and check out the station.

I used a VFO too, Ranger I. Then again, my first transmitter was a single
tube 50C5 on a piece of plywood and one rock.

Source record: 18962

The thought came to me the other day whle thinking about the cost of 6JB6's nearly $100 for a set; I paid $18.00 for a matched set of three at AES back in the 1970's and I got plenty of spares. Why did Drake use those cheap ass sweep tubes in their final instead of the old standard 6146 to begin with?

Sure, back then it seemed in vogue to use sweep tubes in amateur gear (yea, sure, Swan gear...) but as I recall, we thought that Drake was kinda cheesy to use those tubes anyway. I gonna stick my neck out and say Drake engineering wasn't the end all that the youngsters think nowadays.

(Yes... I have a complete Drake station (including amplifier)---the whole line-up in pristine, vitrually unused condition in crisp factory cartons including accessories, catalogs and a handful of the right-angle Switchcraft microphone (black cap) and key (red cap) plugs that Drake originally supplied not that PL-whatever. Original owner---me---so it's not sour grapes.)

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap,rec.radio.amateur.swap

I have for sale a Heathkit DX-60 transmitter in fair to good cosmetic condition. All of the parts are there and the previous owner said it works, but I haven't tested it (no crystals or VFO). Asking $50 plus shipping from 68132.

I also have an SB-401 transmitter for parts or restoration. It is missing the finals and mic jack, but otherwise looks to be complete. Asking $75 plus shipping from 68132.

Finally, I have an SB-303 receiver in excellent condition. No scratches, dents, or dings. The Heathkit power cord and jack has been replaced by a more common computer type cord and jack, but it looks to be all original besides that. Asking $200 plus shipping from 68132.

I'll take cash for the above or will trade toward an Icom 706 or similar mobile HF rig, IC-736, Yaesu FT-840, or working Swan gear.

Please reply via email to jcamp2@cox.net.

Thanks and 73,
Jeff

I don't recall the 6146 was that expensive. We could find them at the hamfest, surplus and they were routinely given away from one ham to another... heck, Heathkit used them, Collins used them... (not to mention the ham and commercial gear in the 60's) and to think that Drake had to use a sweep tubes in gear that many of us thought was somewhat superior to Collins. By the 1970's the 6146 was so plentiful that they really weren't an issue. It was the sweep tube that turned many of us off---but then the Drake name seemingly overshadowed whatever disappointment we had. Remember how you hated to tune up from fear of destroying those things. Gee... I remember those sweep tube CB amplifiers that fed the CB craze of the 70's. What was it... 12 6DQ6's in parallel or something gosh...

There may be more to it than that. The advantage of sweep tubes was that they worked very well at lower voltage. For the same power level, the 6146 required more voltage. Also remember this was before the 6146B arrived.

I am not a collector of Drake equipment (and I am not a fan of sweep tubes), but didn't the TR-3 arrive first? Three tubes were used for a lot of power. The use of the sweep tubes there may have set the foundation for later transmitters and transceivers.

I remember a conversation with a friend some 45 years ago. He was lamenting that the Hallicrafters HT-32 used the 6146, because it was so wimpy and actually had lower plate dissipation than the 807 it was supposed to replace. He returned the HT-32 and bought an old Harvey Wells Bandmaster. Then worked the world on 10 meters with that rig.

If you have all that gear in that kind of shape,
$100 invested in the correct tubes seems like a very good idea.

It followed me home from the Tulsa hamfest, made for Simpson by Metrawatt in Nurnberg, Germany July 1972. It's the first one I've ever seen. It's a bridge for measuring CLR and has 2 inputs on the back for plugging in an external source. I wonder how high the external source can be? Seems to be very well designed and laid out ergonomically It uses two Burgess D6 batteries in parallel, kind of strange to since they would be fighting each other. I put a pix up at abpr. Anyone have a manual or other info?

>sweep tubes in their final instead of the old standard 6146 to begin with?

Because they were just so phenomenally cheap. Sweep tubes were plentiful
and inexpensive and compared with similar power output transmitting tubes
it was hard to justify the cost in a non-ruggedized installation.

>Sure, back then it seemed in vogue to use sweep tubes in amateur gear (yea,
>sure, Swan gear...) but as I recall, we thought that Drake was kinda cheesy
>to use those tubes anyway. I gonna stick my neck out and say Drake
>engineering wasn't the end all that the youngsters think nowadays.

It was built to a pricepoint like everything else ever has been. A somewhat
higher pricepoint than the Swan gear, mind you, but it was not built without
design constraints.

This book has a lot more information on Backporch than on tactical comms,
but there is some discussion of tactical radios and procedures on both sides:

Military Communications: A Test for Technology. BOOK. 1986. Describes the advantages and disadvantages of high technology in communications, as applied to battlefield operations during the Vietnamese Conflict. Emphasis is placed upon the building and installing of communications systems from 1965 through 1970. Transfer of the communications systems to the South Vietnamese from 1970 through 1973, is also discussed. (Clothbound) 535 p.; ill. 0-16-001623-1
D 114.7/3:C 73/hard.

Yes, but his point is that originally they were a few bucks each at the
drug store. These aren't exactly the most robust tubes around, and nobody
today would EVER think of using one in a new design.

Back in the seventies, people were rebuilding old surplus gear to take
sweep tubes because they were so cheap and plentiful. Today people are
rebuilding ham gear built for sweep tubes to take transmitting tubes.
It all goes back again.

What you say is true for a ham in need of just replacing a pair of tubes. But it would not have been true at all for Drake.

A company producing ham gear cannot depend on tubes found at a good price here and there. They have to place a contract with a tube manufacturer who can guarantee delivery in time and in the required quantities. Prices are then market prices, not surplus prices.

Fine Colin... but some of us used the HP-23 Heathkit power supply for the Drake tranceivers---Heathkit used the 6146 for virtually all of their transmitters and tranceivers. I myself used the HP-23 for powering my TR-3 with no problems; of course, the jack had to be changed and re-wired. The HP-23 delivered 700 volts under load---admittedly a bit higher than what Drake wanted for their sweep tubes; 650 volts.

I think the 6146 pre-dates the Drake rigs. I believe the 6146 came out in the early 1950's along with the 5763 which supposed to be it's driver (Drake used the 12BY7A as a driver). I remember the RCA ads for those tubes on the back of QST.

Actually, I think Drake was pretty clever. The tubes cost roughly half as much as a 6146 and had about the same capabilities. Drake was smart enough to run them within their ratings, unlike most other manufacturers that used horizontal output tubes and tried to sqeeze every last watt out of them. Add to that the fact that (according to tests results in the Bill Orr Handbook) they actually had less distortion than the 6146 in linear service, and it looks like a darn good decision.

I still remember a friend of mine running his TR4 full bore on 20 meters RTTY back in the 1970's. He never had a problem.

If things get really tough, try what I've done. I have some 12JB6's and some 18JB6's. The final filaments can be re-directed and run via an external xformer. It works fine. However, I just bit the bullet and bought several pairs from reasonable sources. Given the number of hours I use the Drake C-line each month or year, I'm sure I'll be OK until I "check out of the net".....

According to my Radio Handbook (Orr) 18th. edition (1970) on page 383:

"To date, the use of inexpensive TV-type sweep tubes as linear amplifers in amateur SSB gear has been acceptable, regardless of the rather high level of distortion inherent in these tube types."

I checked the spare parts price list for my TR-4 (January 1, 1977) on the price of the 6JB6---$4.83. This seems to be in the same price class as the 6146 not to mention that the 6146 tubes were commonly available as surplus from military or commercial services.

I also operated RTTY with my TR-3 but I had a blower on my tubes.

I took a look at Google, but such "modern" equipment is hard to select if the manufacturer still exists (BBC Goertz Metrawatt) and many many traders are filling the WWW with the actual products.

This (your) "modern" equipment seems not to be "collectable" in the definition of "antique",
and OEM products like yours does normally not find the way back to Germany.
The products for the local market are mostly in use at home or at institutes with low budget
(or little Suebian companies ;-)
or scrapped if defective and no schematics are available at www.schaltungsdienst.de ,
but there are no pictures, you must search for manufacturer and or model.

What I've found by chance:
The founder of Metrawatt was Siegfried Guggenheimer.
Take a look at abpr for a bridge from about 1912.

> > It's
> > a
> > bridge for measuring CLR and has 2 inputs on the back for plugging in an
> > external source. I wonder how high the external source can be?

A universal bridge is designed for about 30V, maybe up to 50V ext source.
Some only DC (for capacitors), others additionally AC (low frequency).
TAKE CARE: THIS STATEMENT MUST NOT FIT TO YOUR BRIDGE!

You miss the point. Drake didn't buy their tubes from the surplus market. They bought them bulk packaged from the manufacturer. It did make sence from their standpoint and it didn't compromise the product. From a boatanchor standpoint I wish they had used 6146's. But when put in their shoes in 1963, it was a good business decision.

Most horizontal output tubes have distortion products comparable to the 6146 if you keep the voltage and power down to reasonable levels. Third order products are typically in the -25 Db range which is right in there with the 6146.

Doug -

Here are come Alpha 76A resources.
I have a 76A that I just refurbished beginning of year (new capacitors,
etc.)
http://www.alpha-amps.com/html/76a_pix.htm

BAMA has the Adobe Acrobat
http://bama.edebris.com/manuals/alpha/76a/

There are a couple of resistors on the HV board that Alpha recommends be
moved up to 1 watt in size --
opposite edge of PC board from 6 HV capacitors.

Matt Erickson, KK5DR has a "care and feeding guide" for the Alpha 76A
Guide was recently updated and is a 1 Mb file (Adobe Acrobat)
http://www.qsl.net/kk5dr/OLD76.pdf

Dick Byrd's web site
http://www.n4uq.com/

Alpha keying specifications
http://www.alpha-amps.com/html/ampkey.htm

If your 28 volt control line is "out" .. the meter bulbs will not light
For 28 volt control line - check these components:

D107 and D108 - rectifier diodes on PC board
C108 - filter capacitor
R115 and R116 -- R115 can "open". Alpha now suggests a 1 watt resistor
instead of the original 1/2 watt
[This was original problem with this Alpha in 1979 - when my Elmer owned it]

The tap from R115 goes to the Cathode Bias line for the 8874 finals

Another point of view: If a ham needed new final tubes he could buy
them at any TV shop or parts house, but the 6146 wasn't always available
over the counter without a wait.

Time for my monthly chassis request. I recently acquired an RCA 13K console.
The speaker is present but the chassis is missing and I'm hoping someone
here has a 13K chassis they would be willing to sell. I'd even take another
speaker if I had to.
I was told that the 15K chassis will fit into my cabinet as well and will
work with my current speaker. If anyone has a 13K or 15K chassis they would
be willing to sell please send me an e-mail.

Regards,
Geoff

1322. Anyone figured out how to use a Yaesu FT-727R HT on 447.020- ?

If you have figured a way to modify your FT-727R dual bander I would
really like to hear from you. The emergency group I am a member of has
a new repeater and I cannot program the radio to the "new" band plan
frequencies.

Thanks--
Alan AA6DW

Hi All,
I have a siltronix 1011D that I can not turn down the carrier on
AM, In SSB the radio works fine. Can anyone help me in trouble shooting
this problem ? The carrier control has very little efect on the carrier
level. I replaced the carrier insertion control potentiometer, But that
did not help at all. :(Any help from you will be greatly appreciated.
Thanks.

Dave

I don't understand the desire to reduce the carrier in AM. I've always wanted the fattest carrier possible (most power) consistent with 100% modulation.

In the old days, CBers would jack up the carrier level (by reducing value of the screen resistor on the final tube, for example), but of course the modulator power remained the same, and therefore the percent modulation wound up somewhere around 75%. On the other end, the receiver AGC, responding to the carrier strength, would lower the receiver gain and result in sometimes unreadable audio.

Perhaps that is the problem with the Siltronix.

I had one about twenty five years ago. I fixed the TVI problem by adding
a low value
capacitor from the final grid to ground and put a small value coil in
the grid lead.
That made a low pass filter in the feed to the final. It worked great.
But I didn't
keep any record of the values I used so you are on your own.

I wish I had kept that transmitter.

Message-ID: <0Pm0e.691760$b5.31303421@news3.tin.it>
Source record: 18927

Noone has raised the issue of how long 6JB6s last.

If they are used with caution they last for a long time, but if one tries to squeeze the last watt out of them (and the 6JB6s invite you to do so, thanks to their strong cathode emission) they can last for a VERY short time.

The 6146 have a lower cathode emission and do not then lend themsleves to be squeezed so badly as the 6JB6s. So there is less harm to inadvertently destroy them.

To my experience the Sylvania 6JB6s (those sold by Drake as spares) perform better than the GE 6JB6s, and are are easier to neutralize. The RCA 6JB6s, luckily much less common, were no good.

> another... heck,

What you say is true for a ham in need of just replacing a pair of tubes.
But it would not have been true at all for Drake.

A company producing ham gear cannot depend on tubes found at a good price
here and there. They have to place a contract with a tube manufacturer who
can guarantee delivery in time and in the required quantities. Prices are
then market prices, not surplus prices.

73

Antonio I0JX

Well, the tube (6146) was in constant production during Drakes operation
(about 30 years) so it would imply that they were very common and
cheap---practically every other amateur equipment manufacturer was using the
6146. Large numbers were used by the military and commercial services. My
gosh... if Heath was using them they certaintly couldn't have been that
prohibitive to design with. So it begs the question why Drake was using
them.

> Michael A. Terrell
> Central Florida

Well... maybe if you were using a single tube that would be the case. The
Drake gear (besides gear from other manufacturers) used more than one tube
requiring them to be matched. I recall Drake sold matched sets of tubes
after checking their cathode currents in a test fixture. The tubes were
them marked and collected into sets for sale. I recall seeing the number
'18' on the envelope of a matched set of 6JB6's. What '18' meant I just
don't know. I also recall some folks back then claim the the tubes were
also matched on the basis of plate capacitance. I'd look at the matched
sets that I have but they have been in sealed packages for nearly 30 years
so I hate to open them.

The 6146's weren't a problem... we always seemed to get them if we needed
them---they seemed to be everywhere. They were sort of like antenna
insulators---if you needed them someone had them and would give them to you.
I never bought a 6146... One fellow gave me a couple of boxes of 6146W's

(yea... they were in the white boxe with the black print on the side ;-). A lot of manufacturers were using the 6146's in their designs and the tubes had been around a long time---for decades.

73

Tony, I0JX

Absolutely Tony... I share the same experiences as you. I've recently listened to the youngsters getting their hands on the Drakes but not knowing how to tune the pi-network with the consequence that they destroy the 6JB6's in short order---and having to put out $100 for another set. Those sweep tubes weren't very forgiving... If I remember, we never really worried about hurting the 6146's as they seemed to keep on working. Furthermore, correct me if I am wrong, I don't think we ever considered having matched 6146's like we did with the sweep tubes.

Source record: 18941

I agree. There is little, IF ANY, correlation between the "consumer" price of components and the commercial (manufacturers') pricing. Besides the quantity discount, there are other factors: One is that Drake may have, and probably did, buy other tube types from the same supplier (which may not have been the tube manufacturer!) That can leverage prices downward on one, a few, or all types. Other components come into play too, for different tube types may not use the same sockets, and may require different designs for stability, etc so that a particular tube might require, say, a more expensive bypass capacitor (just an example). Then there might have been power supply consideratons involving the different voltages/currents for the different types. These decisions are made in the early stages of design, and usually revolve around what is the cheapest way to achieve the desired result. Even if, at a later date, experience factors dictate using a different tube, I doubt that (in this discussion case) the cost/benefit tradeoff would favor going to the 6146. In order to know whether Drake was smart, we need to know all the decision factors and conditions at the time. Of course, hindsight always has 20-20 vision.

In the good OLD tradition of Hamming, those who so desired could do their own engineering redesign. Yank out the sweeps and associated circuitry/components if you didn't like 'em and build out with 6146s.

73,
Dube K4DWW

Ha ha, I forgot ... its 15 miles just north of my QTH ! .. Dearborn, Belden
just purchased them this past year !
http://www.dearborn-cdt.com/

Dearborn National Headquarters & Manufacturing Plant
250 West Carpenter Avenue , Wheeling, IL 60090
Phone: (800)323-0198 or (847)459-1000 Fax: (847)459-0170

The black is available in Nylon and Polyesters (MilSpec).
Natural color for Nomex and PTFE (MilSpec) and Telecom grade

Dearborn/Belden CDT's Telecommunications Grade Lacing Cord was designed
specifically for the telecommunications industry.

Lacing Cord is used primarily for "stitching" or "lacing" cable bundles.
The product offers good resistance to most mineral acids and weak alkalis,
and moderate resistance to strong alkalis at room temperature.
Cords are designed from first grade, high tenacity continuous filament
polyester coated with a microcrystalline fungicide wax and are available in
9 ply or 12 ply constructions.

Military Grade lacing cords or tapes are also available in a wide variety of
finishes and Mil Spec approved.

Yeah, I was thinking the same thing. Then again - it did seem like there was something in the early units that the later one didn't have (interface stuff perhaps?). Been much too long!

best regards...

Its very simple. POWER sells. Sweep tubes have that extra output for the bigger price tag. A $9.00 sweep tube in the 70's cost a dealer $3.00. Cant imagine what the low cost would be to a manufacturer. Bottom line for all companies......PROFIT.......PROFIT.........PROFIT.

What I remember was that the RF head (turret) would hang up once in a while due to poor alignment between the contacts, fixed and on the head. Was a bearcat to fix and usually meant replacing the head as by the time the ops turned it in for repair, the contacts were shot.

Oh well, been a long time for me too.....still got couple 390A's though, great fun.

Looks like the 28 volt supply is gone, nothing out of the transformer, so guess the winding went open. This belongs to a fellow ham and know he wont want to go the cost of another trans, so will just sneak in a little trans to make up the need for control voltage. It'll work fine.

Thanks for the interest

From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <d231cu$e5c$1@hercules.btinternet.com>
Source record: 18859

This program predicts approximate performance of general purpose, multiband, horizontal loop antennas of given perimeter of loop. It is not intended for precision predictions of operating data.

A loop is a continuous wire without loading coil or capacitor. It can be of any shape provided the area enclosed by the loop is not less than 2/3rds of that of a circle of the same perimeter, ie., it is not too irregular.

It is the sort of antenna which is forced on the amateur by the shape of his back garden and the pre-determined location of trees, poles, buildings or anything else from which an antenna wire can be suspended.

Analysis includes a high or low impedance feedline, a choke balun and an L-tuner. The antenna is most efficient when the perimeter is a whole number of wavelengths. It is least efficient when the perimeter is an odd-number of 1/2-wavelengths. But operation is not limited to being at, or near to, resonant frequencies.

Download in a few seconds program RJELOOP4 from website below and run immediately.

When the Drake vacuum tubes rigs were designed, the sweep tubes were being mass produced for the TV market and WERE very cheap.

However, there may have been another reason.
If I remember correctly, the advertised power output of the TR3/TR4 and the T4X, etc was higher than the 180 watts input/100 watts output that was typical from a pair of 6146's. A pair or trio of sweep tubes is capable of a much high PEP rating than is a pair of 6146's - albeit maybe not for long....

Thus there was a marketing race at the time.
Each manufacturer was claiming higher and higher power levels for their "bareful" rigs.
Swan was surely the champ with that - claiming up to 700 watts input and about 500 watts output for some of their rigs.
Drake didn't go so far but probably still wanted to claim more power than the 180 watts input/100 watts output of Collins and Heathkit.

National also used sweep tubes in their transceivers. For example, they used the 6GJ5 in their NCX-3 and the NCX-5 and at first were conservative with their rating, also claiming just 180 watts in/about 100 watts out. Later they joined the PEP race with their NCX-500, etc.

Thus part of the answer may simply be marketing.

73,

Doug/WA1TUT

1373. FS: Hallicrafters, National, Millen and Electrovoice Goodies and Test Equipment

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-03-26 16:11:15 UTC
From: dave <n7rk@cox_nospam.net>
Message-ID: <DQf1e.2192$Qz.40@okepread05>
Source record: 18862

Here are a some items for sale. Prices do not include shipping. I will ship overseas. Remove "_nospam" to reply to me.

Hallicrafters SR-42.....$75 plus shipping
A separate transmitter receiver that puts out 5-6 watts and covers 144-148 MHz. This is a crystal controlled radio that also has provisions for the HA-26 VFO It will probably will work with other VFO's with an 24 MHz fundamental frequency. The transmitter uses 24 MHz crystals and includes two crystals for 145.14 MHz and 146.52 MHz. I used this for a while with the HA-26 VFO to check into our local 2 meter AM net. I recently obtained a Lafayette 2 Meter AM rig so this is surplus. The unit works well and has good audio. It does have some scratches and spots where the paint is missing. Includes the microphone, power cord (often missing) and a photocopy of the manual.
http://members.cox.net/radiodx3/hallisr42.JPG
http://members.cox.net/radiodx3/hallisr423.JPG

National Type ï¿½Bï¿½ Dial.....$40 plus shipping
This is the same dial as used on the National SW-3 receiver. This dial is in very nice condition. The Bakelite is shiny and the chrome is also shiny. Nice dial for a receiver or a home-brew VFO project.
http://members.cox.net/radiostuff9/nat_sw3dial.JPG

Electro-Voice EV-621L Dynamic Desk Microphone.....$65 plus shipping
Low impedance desk mike. Tested and working, the mike is in nice shape with a few minor scuffs.
http://members.cox.net/radiostuff9/ev621l.JPG

Hallicrafters SX-25 Receiver and Matching PM-23 Speaker.....$500 plus shipping
The SX-25 is a 12 tube receiver covering 540 kHz to 42 MHz in 4 bands. These were built in 1940. The PM-23 is the matching speaker which was also the matching speaker for the famous SX-28 and the SX-24. This radio also has a crystal filter which is signified by the letter "X" in the SX-25 number. The receiver has a pair of 6F6's for the audio output and this radio has wonderful audio when listening to short wave broadcast. This radio is in beautiful condition for a 65 year old receiver. It even has the Hallicrafters notification card still in place on the bottom of the radio. It plays well and sounds excellent with the matching speaker. The speaker is also in great shape however it has one tiny screw hole on the top of the cabinet near the back. This is barely noticeable. Includes a photocopy of the manual.

James Millen Frequency Meter Set I-129-(B) (Wavemeters).....$75 plus shipping
Military set of four James Millen wavemeters covering 1.5 to 40 MHz. This is the Signal Corps U.S. Army version and the box says manufactured by Munston Mfg. and Service. The wavemeters were manufactured by James Millen. These are in excellent condition. The wooden carrying case has the callsign of a previous owner. Here are the frequencies of each wavemeter:
*Meter No. 1: 1.5-3.5 MHz, *Meter No. 2: 3.5 - 8 MHz, *Meter No. 3: 8 - 18 MHz, *Meter No. 4: 18 - 40 MHz

http://members.cox.net/radiostuff9/wavemeterset.JPG
http://members.cox.net/radiostuff9/wavemeterset4.JPG

Hewlett Packard HP 651B Audio Test Oscillator .....$90 plus shipping
This is a highly stable capacitance tuned oscillator that will go from 10 Hz to 10 MHz so it can be used as an both an audio oscillator or low frequency RF signal generator if you don't need to go above 10 MHz. It has a sine wave output adjustable from 10 microvolts to 3.16 volts into 50 or 600 ohms with two separate outputs through the front panel connectors. This is a working unit. Does not include a manual or power cord.
http://members.cox.net/radiostuff9/hp651b.jpg
http://members.cox.net/radiostuff9/hp651b2.jpg

Military VTVM ME-260/U with RF Probe.....$55 plus shipping
Nice well built working military unit with RF probe.
http://members.cox.net/radiox3/mil_multimeter.JPG
http://members.cox.net/radiodx3/mil_multimeter2.JPG

Quantity of 2- Price Electric Relays.....$35 each plus shipping
These have N-connectors and are extremely well built. I believe they are VHF/UHF relays
http://members.cox.net/radiostuff9/uhf_relay.JPG

Thanks for looking.

Hi, I wonder if any morse key collectors
out there can help identify this key
http://www.atdi24.dsl.pipex.com/mystery_key.htm
Most of it looks original except for a piece of
ali across the bridge, it has reference numbers
which don't seem to relate to anything
AM Ref No 10F / 8782 P.S.4707G No 142581
It points to an Air Ministry key but I've found
nothing similar..
Its a fine key, with a very nice action.
recent ebay purchase :)

Source record: 18867

Ralph,

According to a measurement shown in the service manual, the headphone output is designed to _drive_ 4 ohms. It shows an audio frequency measurement with a 4:600 ohm step up transformer. The audio output circuit is an op amp in parallel with 1.012K ohms (with a DC blocking capacitor in series with the output.)

If you don't need the sidetone when transmitting in CW for your accessory, there is a line output from the accessory socket that is independent of the volume control that may suit your purpose. The level is listed in the manual as 0 dBm into 600 ohms. The squelch is not operative for the line output.

73,
Bob AD3K

OK. Remember that this winding grounds the center tap (white wire).
I assume you checked for corrosion, etc. on Molex pins/plugs (and ruled
this out).

If this is a three- tube .. a Hypersil would be a nice changeout (Peter
Dahl).
I have talked to Alpha from time to time --
I think Alpha also uses a similar size one in the current amplifiers.

When sizing the add-on - remember that the 28 volt line:
Supplies the 8874 control grids and is used as a "bucked" winding for the
blower.

Source record: 18869

You mentioned that Heathkit used 6146's in virtually all of their
gear. That is a valid statement, but they used 6GE5 sweep tubes in
the lower price-point HW-series monobanders, including the ones for
MARS/CAP. It was a purely a matter of economics, I think. Retail
price aside, there had to have been more manufacturing volume on the
sweep tubes, because just about every family had a TV set.

I now have a 4B-line, and also a bunch of HW-series rigs. The 6GE5's
are fairly inexpensive even today, compared to 6146A's or W's or the
later GE 6146B's that Heathikit blessed.

Thanks for the info. I saw the configuration for the 28v winding in the prints. No corrosion that I can find, and nothing coming out of the trans on the 29v leads. Only possibility is that it's open at the connection point. So.....you're right, the hypersil trans would be a great addition. This is the 2 tube model, but a good amp.

Onward, we'll see what he wants to do.

Thanks again

Yup... for sure... I forgot about those monobanders. I even had one
myself---the HW-32A.

Well, you raise the question that's been on my mind for quite awhile---just
what was the production on the 6146? I don't have the slightest idea how to
find that tidbit. They were well in production before TV became
commonplace---maybe 10 years or so. Just what was the production figure on
the 6JB6? To be honest the 6JB6 doesn't sound like a common tube. I recall
the horizontal deflection amplifier tubes like the 6DQ5 and 6DQ6 but looking
in my 1961 RCA tube handbook I don't seen the 6JB6 listed.

I recall, Kenwood had 6146's in their TS-520, correct me if I'm wrong but
wasn't it a 6146 of Japanese production (I remember they had the shiny
chrome finish on the metal surfaces that typified some of the Japanese
parts)?

Well said Doug... I forgot about that---there was a power race back in the 70's. Some of us did get 'big eyes' when Swan came out with the 500. And now that you mentioned it, I remember some of us looking at the Drake's 300 watt (input) tranceiver as a selling point (I think the power race ended somewhat with the advent of solidstate and the fairly uniform 100 watt specification).

Drake had a problem meeting their power claim later for the TR-4C/CW/CW+RIT (I don't know about the older models), resulting from the changes to FCC regs regarding spectral purity (97.73). Drake had a notice that the final could not be loaded to more that 350 ma. so as to remain within the new spec. The older tune-up procedure reached maximum output with a plate current of 380 to 500 ma. I am not going to venture to say if the 6JB6's had anything to do with having to go to a reduced output as opposed to using the 6146's in their place regarding spectral purity but I sure would like to hear comments on this point.

I like the note in the operators manual regarding tune-up:

3-7. TUNE UP. Do not allow plate current to exceed 0.1 Amperes for more that 6 seconds with the PLATE control not tuned for minimum plate current or maximum output.

CAUTION Failure to observe the warning above will result in rapid final amplifier tube deterioration due to excessive plate dissipation.

FWIW, the instruction manual for my NRD-525 receiver says about the
headphones jack, "Use headphones with an impedance of 4 to 16 ohms.
Stereo headphones can be used without modification."

Hi, Gang

The 6146 was introduced by RCA in Jan 1952 QST (full page ad).
It was advertised as the big brother to the 2E26, which had been around
since about 1946.

73,
Ed Knobloch

Well here is how you find stuff

Go to this URL:
http://www.google.com/

Type in 6146 vacuum tube (Web Search)
Get several responses -- weed thru them
In the second down is Issue 6 Articles
which sez
the type 6146, was new in 1952.

Wanna see a photo of a 6146
Use google and search images for 6146
Wanna see a pinout
use google and search images for 6146 vacuum tube

Please make a note of it. Google that is -- can find damn near anything.
Including you -- see search groups

--
CL -- I doubt, therefore I might be !

Dear CL

Thank you sincerely for confirming my search procedure on the 6146
thermionic valve.

True to your word, I have already found the data that you mentioned in your
reply. I also managed to download the relevant pages from the RCA tube
handbook (1964) concerning the 6JB6, 6JB6A and 6146 for later study at my
leisure.

I still have yet to find the production data of the 6146 (how many manufactured)---my two hour long Google search still has come to naught. Similarly, production data for the 6JB6 (how many manufactured) has escaped me as well and would be of additional interest in this running thread.

I agree most heartily, I have made a note of the Google search engine---as a matter of fact, I have made it my home page for nearly ten years!

Fraternally yours,
RG

Thank you Ed for the information. I knew the 6146 went back to the early 50's or so but I didn't know it was 1952; I did find tube specifications dated May 1952 though. I had absolutely no idea that the 2E26 went back to 1946---that is interesting!

I remember those RCA ads on the back of QST; they probably would look real nice in the radio-room after being mounted and framed. I recall one that proudly advertised the 5763, 2E26 and 6146 as the ideal tube line-up for a transmitter.

Oopps a case of confusion on my part

When you sed "I don't have the slightest idea how to find that tidbit."

I thought you were talking about the first production date.

So apolgies from here.

Interesting you had google for 10 years as goggle sez:

Two Stanford Ph.D. students, Larry Page and Sergey Brin, founded Google in
1998.

As I sed Caveat Lector

It might be tough to find the data on the total number of 6146's
produced since RCA was not the only manufacturer of the tubes. RCA,
Sylvania, GE, at least one Japanese firm and possibly others produced
the tubes. Likewise, a number of manufacturers produced 6JB6's.

Not quite. Yaesu used sweep tubes widely as did Swan, WRL, National, Heathkit (in some transceivers) and even Hallicrafters (in some transceivers).

> Large numbers were used by the military and commercial services. My
> gosh... if Heath was using them they certaintly couldn't have been that

> them.

They likely got really good prices on them. In addition, a pair of 6146's was good for 80-100w output. A pair of 6JB6's in the Drake T4-XC was good for about 140w. Swan and WRL pushed a pair of other tubes to even higher output.

You can computer match it at better paint stores (or even auto body painting
specialists)

You should also inquire with Dee Almquist, W4PNT
He does E.F. Johnson painting, refinishing and silk-screening
http://w4pnt.8k.com/refinishing.htm

==========
Old ARRL HAM Radio Publications

"Specialized Communication Techniques for the Radio Amateur", 1975, 208
pgs, "#124" written in ball point under price on cover, otherwise perfect.
Includes overview, ATV, SSTV, Facsimile, RTTY, Space, others.

"Single Sideband for the Radio Amateur", 1958, 212 pgs, back cover
missing, spline and binding worn, outside fair condition,
inside pages very good condition.

"How to become a Radio Amateur", 1968, 94 pgs + ads, front cover
has 2" tear, slightly faded, outside overall good condition,
inside very good.

"How to become a Radio Amateur", 1974, 84 pgs + ads, slightly yellowed
pages, oil stain lower inner 2" on all pages, otherwise good condition.

"A Course in Radio Fundamentals", 1960, 103 pgs, very good condition.

"The Radio Amateur's License Manual", 1961, 83 pgs + ads, front cover
and spline quite worn, back cover missing, overall fair condition.

"The Radio Amateur's License Manual", 1976, 120 pgs, slightly faded
covers, overall good condition.

Old QST Magazines

QST, October, 1944, 104 pgs, slight wear on spline, overall good condition

QST, September, 1975, 168 pgs, very good condition.
ARRL National Convention Issue.

QST, January, 1976, 136 pgs, small (1/2") tear on edge of cover, overall
good condition

QST, December, 1977, 188 pgs, good condition

QST, September, 1980, 180 pgs, good condition

QST, November, 1986, 164 pgs, good condition

Old AMECO Publications

Ameco, "Radio Amateur Q&A License Guide", 1956, 32 pgs, good condition

Ameco, "Novice Class Radio Amateur License Guide", 1980, 32 pgs,
very good condition

Ameco, "General Class Radio Amateur License Guide", 1980, 64 pgs,
very good condition

I don't know how one could track down the numbers, but I've been thinking about the relative abundance of these tubes.

The 6JB6 was a Novar version of the 6GW6 octal sweep tube. In the early 60's RCA was introducing Novar sweep tubes, some of which were electrically the same as earlier types, and some of which were new. GE was doing the same thing with 12-pin Compactron sweep tubes. The 6JB6 was meant for black-and-white TVs, but by the mid 60's, comparatively few B/W sets used transformer power supplies -- most were "portable" sets with series-string heaters, and would have used, for example, a 17JB6 in the horizontal output. So the 6JB6 was probably not a huge seller, compared to the 17JB6, or to the 6-volt color tubes like the 6JE6 which were used a lot.

The 6146 was originally designed by RCA in response to George Grammer, W1DF, QST technical editor, so it came about because of amateur radio, but it was used in large numbers in GE and Motorola VHF 2-way radios.

There were a lot more TV sets than 2-way radios made, but it could be that the relatively small number of transformer-powered black-and-white TVs in the 60s meant that 6JB6 production was fairly low. I wouldn't be suprised if there were more 6146's (of all variations) made than 6JB6's.

Hi Gang:

I'm thinning out the pile of accumulated "stuff" under wife's orders and I really don't need so many radio books.

This is the 15th Edition of the RADIO HANDBOOK published byEditors and Engineers in 1959. It is in good readable condition; no water damage or anything like that but the spine is damaged a bit. Seems that a 2" X 1/2" long piece of the fabric covering is missing.

Anyways, it's up for grabs. I am asking $12.00 including shipping by Media Mail. If interested please reply by e-mail.

Mike,
I read it in a QST from sometime in the late 60's -- it wasn't a feature article but a "Stray", I think, about the millionth 6146 (or some other notable number, I think it was a million) produced by RCA. I just did a quick search of the QST article database on the ARRL website with no luck, but if I find the article, I'll post something.

I don't know if there are any other cases of a tube being introduced especially because of an amateur need (although RCA certainly marketed the 6146 to land-mobile and other markets right away). It was envisioned as a sort of "modern 807" in function, although it's obvious that it's a scaled-up 2E26 if you look at the tubes.

Your post created a flashback into the 1960's for me.

We built a Cantenna and had no transformer oil to cool it, so went down to the local Eckerd's Drug Store and gathered up 4 quarts of mineral oil off the shelf. At the checkout, setting the 4 quarts of oil down for the clerk, she asked, "Oh, is this on sale?"

"No, Ma'am, but he's got an awful problem.", I overheard myself saying of my ham buddy standing next to me before I could stop it....(c;

She turned as red as I've ever seen a woman and checked us out quickly, I suppose so we could get started fixing the problem....hee hee...

Sorry I don't have a Cantenna any more or I'd just give it to you....

Yeah, I had the same experience with my Heath Cantenna -- the drug
store only had small bottles of mineral oil; I showed up at the
counter with about a dozen bottles of the stuff. They probably figured
I was building a bomb or something...

On April 15-17th, the Shreveport Amateur Radio Association
will run Special Events Station W5E from the Eight Air Force
Museum at Barksdale Air Force Base in Bossier City, Louisiana,
home of the 8th Air Force. The station commemorates the 60th
anniversary of the last combat mission of the 8th Air Force
over Europe. An authentic SCR-287 WWII bomber radio station
will be on the air, along with other equipment working all bands.
A beautiful QSL will be sent to stations contacted.
More information is available at:

http://www.k5sar.com/HTML/SEW5E.htm

Authentic WWII SCR-287 Station Operation:
The WWII Bomber radio station, SCR-287, running 70 watts of AM,
will operate on 3880 KC on Saturday, April 16th from
6 PM until 10 PM Central time, plus or minus 5 KCs for QRM.
There will be a special endorsement to your QSL for working
the vintage station(s). Please note that WWII equipment is
not YeaComWood; some drift may be expected.
We respectfully request the support of the AM community for
our operation of this event. We will also have a complete
and operational SCR-274N station, as well as a display of
the radios used in ferrying operations by the
Women's Army Service Pilots and Women's Army Corps during WWII.

As time permits, we plan to also operate the vintage equipment
on other freqs. Look for us around 1845, 3545, 7045, and 7245
(WWII ended in 1945).
Thanks and hope to work you.

I strongly recommend using a modern replacement. Honestly. If you stick
a NOS cap in there, it's not going to last long. I think you're a lot
better off with one of the inexpensive Panasonics from Digi-Key.

We all must have a somewhat warped mind when it comes
to a Cantenna! I hauled the 4 quarts of mineral oil
to the counter and set it down. The clerk had a bit of
a quirky smile on her face. I looked up and smiled and
told her "This stuff is REALLY good when you mix it
with Jack Daniels"! I also wanted to also say "It's
also good to give your dogs when you want to fertilize
your yard" However I was having trouble suppressing a
huge laugh from the look on her face so I just clammed
up. Fun stuff! What other hobby can you have such
fun in especially in the medical field!

==========

Mike -

First, bookmark the DRAKE Home Page operate by WB4HFN
Large number of articles on Drake equipment repair, tips and component replacement
http://www.wb4hfn.com/DrakeHomePage.htm

The Internet has replaced the inefficiency of searching large paper books and documents.
That's what GOOGLE and search engines are all about (modern day card catalogs for the Internet library)

Drake AC-3 / AC-4 troubleshooting by Mark Gilger, WB0IQK
http://www.wb4hfn.com/DrakeArticles/TechTips/PowerSupplyTroubleshooting.htm

YOU HAVE SEVERAL OPTIONS -- FOR REPLACEMENT.

1. Use the AC-4R replacement board designed by Mike Bryce of SunLight Energy Systems (available on his web site).
$ 15 plus shipping for the PC board is a bargain.
http://www.theheathkitshop.com/drakeac4rreplace.html

2. You can "rebuild the capacitor" - like Al Parker, W8UT did for his AC-4.
http://www.wb4hfn.com/DrakeArticles/TechTips/FilterCapacitorRebuilding.htm
This was done several years ago with R-390A restorations.
http://r-390a.us/filter_capacitors.htm
Suppliers finally woke up and took note that maybe they should be offering these for restorers (guitar amps, antique radios, boatanchors, etc.)

3. Both DigiKey and Mouser have a wide selection (snap in/screw in) of Panasonic, CDE, Mallory, Vishay/Sprague and United Chemi-Con electrolytic capacitors.
Pages 482 to 486 in Mouser catalog has a wide selection of "cans" (screw, snap in, 105 degree)

http://www.mouser.com/catalog/621/482.pdf

DigiKey - Panasonic TS series
http://store.yahoo.com/triodeel/capacitors.html

4. Antique Electronic Supply also have NOS and new mfg twist locks
http://www.tubesandmore.com/

5. CDE is now selling some of their capacitors "on-line" direct to
customers. 105 degree and 500 volt options available
http://www.cornell-dubilier.com/

6. Triode Electronics (here in Chicago) run by Ned Carlson has capacitors
and a wide range of parts
http://store.yahoo.com/triodeel/capacitors.html

Good luck with it, 73

Thank you Ted for your valuable input regarding the 6JB6. I think I am begining to see a picture develop... Somewhere I learned that Drake was buying those Sylvania 6JB6's for 50 cents apiece. That was fine for Sylvania with a bunch of tubes and no market in TV receivers and made for a better profit margin for Drake. When it came to a choice for a final tube Drake said to heck with the 6146's. I note that inside the rig there was a note that the tubes were to be replaced with Sylvania tubes only. Some speculate that this might have been due to some special deal or understanding between Drake and Sylvania or perhaps it was simply due to lack of interchangability. But then, I think some mentioned that the RCA tubes worked just as well and the Sylvania claim had no merit. Yet, some have stated that the use of RCA tubes introduced electrical instablity at the higher frequency ranges; ten meters for example (neutralization didn't help). Nevertheless, I feel satisfied that Drake's choice for final tubes was primarilly based upon a profit motive---the 6146 would have been a better/proper choice but Drake wanted more more for less so they used those tubes that they salvaged at low cost from a failed niche in the TV receiver market.

Yea... gosh... I hate to admit it... I got on 2-metes with one of those Motorola 'Cement Mixer' radios---the one with the sloping front---D43 I think---it was later turned into a repeater. Gee... lot's of us had those things in the trunk of our cars with that hidious speaker on the dash board and the hand mike---that could be used as a weapon in the last resort. Not to forget the based loaded CB whip modified into a 5/8 vertical for 2-meters. It was years before before Drake came out with the TR-22 (made by Trio/Kenwood), along side with Genave, Kyokuto, Regency...

Different brands of tubes had slight variations in internal
capacitance and could upset the neutralization. By sticking with one
brand you had a better chance of changing the tube and being able to go
right back on the air.

Hi, Gang

The 6JB6 tube used by Drake seems to have the same specs
as a 6DQ6B (octal) sweep tube. Pretty wimpy.
The 6JB6 has a button stem base, and therefore
should be a better high frequency performer than the 6DQ6B.

The 6DQ6 was favored on low-end rigs like the Heath DX-20
or Knight Kit T-60. The Hallicrafters SR-150 used two 12DQ6B's.
The 6DQ6B was a bit beefier than the original 6DQ6 or 6DQ6A.

Sweep tubes are really good at surviving abuse,
at least for short periods. I was trying to tune up
a newly aquired Swan 240 beater, and my first indication
of an intermittant plate meter was the red glowing plate
of the single 6DQ5. I thought that tube was a goner,
but it still worked fine, a hundred watts out with a whistle.

It is a smart conversion to maintain the quiet operation - BUT with a bit
less power.
I have never seen a web page outlining this change (parts, photos and
instructions).

How those tube types bring back memories;. 6DQ6, 6X4, 5Y3, 6BE6, 807, 1625, 50C5, 6AQ5, 2E26, 5763, 6146 the list could go on and I guess every veteran ham has a number/s dear to him or her for one reason or another.

Yea, that 6DQ6 saw a lot of service in ham gear and I had a couple of fist's full of them in my junk box---I even built a transmitter using one of them too. I recall the articles in ARRL handbook and QST using those tubes in transmitters. Those TV sets that we salvaged (sitting on the edge of the street next to the garbage can waiting to be picked up) besides the transformer, all had one in them (or maybe a fellow would hope so). I think if there is any sweep tube that represents the genre of sweep tube designs its got to be the 6DQ6---a classic tube perhaps. The CB amplifiers of the 70's using that tube would make an interesting thread by itself. I guess that tube was too expensive for Drake to use in their designs. I think that is sort of the thoughts that some of us had---why this 6JB6 in Drake gear... like, where the heck did this tube come from? Yet, according to one tube dealer, the 6DQ6 goes for $6 each compared to $20 for the 6JB6.

The 6JB6 was used in about 50% of RCA's B&W TV line from 1964 till at
least 1967. They had power transformers in most 23 inch TVs and high end
19 Inch sets. Zenith also used this tube is some chassis in the 1964 line.

Bill Cohn - N9MHT

Bill, it sure would be nice if you could estimate the number of TV's in that run that used the 6JB6. I suspect those RCA TV's used the RCA 6JB6; what about the Zenith TV's?. Do you have any thoughts regarding the Sylvania 6JB6's?

To answer your question about an estimate of how many sets were in those runs I would gues probably between 100,000 and 200,000 sets. I am sure that its at least an order of magnitude more than the number of Drake Rigs.

Although you would expect that RCA used their own tubes that was not necessarily true. Zenith used both RCA and Sylvania tubes that they had custom branded. It was also not out of the question for RCA to get their run of 6JB6s from Sylvania or vica versa. Not all tube manufacturers made all tube types and often traded types to make it look like they made a complete line.

I once had a Gonset G-76 that ran a 6DQ5 final modulated by a pair of 6DQ6s.
I guess sweep tubes were everywhere.

Have a mint NOS Mosley multi-band antenna STILL IN UN-OPENED CARTON*, TA-53M** (See Mosley site for all specs); lists for ~$803 + shipping + tax. Sale for $503 = $300 + tax total savings. * Note: hardware box did not survive the 'delivery service'though all the hardware items are still sealed in the large, clear, plastic 'sack' and the 12 coils are in great shape. I will rebox for shipment. Antenna box, ~6x6x7ft 3", is stamped at 41 lbs- though I have not checked this weight. You pay exact shipping via UPS or FedEx--no 'Handling' or 'extra packing' fees! I will have 2 digital pics by mid-day on 04-01-05 (not an April joke). You can pay via Pay Pal if you wish.
**4 element, 5 band, 600W-RTTY, 1.5kw-CW, 2.5KW-SSB; 14ft 2" OD boom.

Will try here before going to Ebay. Tnx heytubeguy, Joe

I remember hook-up you are looking for and I may have it somewhere in my collection of books (in storage). This circuit, 'The Slat-Board Transmitter', may be a slight variant of the one you are looking for. It's a pdf of the article that appeared in an early printing of 'How to Become a Radio Amateur'.

FS:Restored Vintage National NC-57 Receiver. This very nice 1950 General Coverage receiver has been re-conditioned as follows: All electrolytic and filters caps replaced. Several resistors replaced. All Tubes tested and replaced accordingly. Fuse installed under the chassis for protection. The two tuning dial windows, which often become cloudy and curled with age, have been replaced with a super clear polycarbonate sheet. The front panel white lettering as been carefully reconditioned. Radio has been re-aligned.

The receiver front panel is in excellent condition. All knobs are original and are excellent .The cabinet paint has been cleaned and polished. There are some abrasions on the top edges (the lid is fine), and the cabinet left side has some scratches but cleaning has help to minimize these. Chassis is clean with a minimum of corrosion. This is a nice restored boat anchor receiver with pleasant sound. Included is a copy of the Instruction Manual .Additional photos available. This model radio was featured in the February & March issues of Monitoring Times. $115 plus shipping (33 pounds) from Seattle.Thanks Larry W8GTT

Joe you should check out early Hand Books. There are several novice rigs
and one with the tank coil wound on lollypop
sticks. This is a bread board assembly.
I have my Handbooks packed away but if you want I'll find the year with
the rig.

I think this is the transmitter you are looking for. It appeared in the
1955 printing of 'How to Become a Radio Amateur'---It's got the coil on
sticks... The article also contains the matching power supply and receiver.
Be patient, it takes awhile to download; especially on dial-up.

I think all the construction articles from that printing is on this web page
(they even have a scan of the front cover):

"The unforgiveable sins this earth must confront and overcome are
Nationalism, capitalism, and hoarding. The idea of every nation
should be forgot, price should be struck from the commons, and
princes should be seen for the devils they are. The sins include
our church, secret societies, and other religions which make of
the spirit of God a divide."

Last rites declaration of Ioannes Paulus PP. II (Karol Wojtyla)
2nd April 2005

--
after that, have no more that they can do. But I will forewarn
you whom you shall fear: fear him, which after he hath killed, hath
power to cast into hell: yea, I say unto you, Fear him."

It is the fierceness of his wrath that you are exposed to. We often read
of the fury of God; as in Isa. 59:18. "According to their deeds,
accordingly he will repay fury to his adversaries." So Isa. 66:15. "For
behold, the Lord will come with fire, and with his chariots like a
whirlwind, to render his anger with fury, and his rebuke with flames of
fire." And in many other places. So, Rev. 19:15, we read of "the wine
press of the fierceness and wrath of Almighty God." The words are
exceeding terrible. If it had only been said, "the wrath of God," the
words would have implied that which is infinitely dreadful: but it is
"the fierceness and wrath of God." The fury of God! the fierceness of
Jehovah! Oh, how dreadful that must be! Who can utter or conceive what
such expressions carry in them! But it is also "the fierceness and wrath
of almighty God." As though there would be a very great manifestation of
his almighty power in what the fierceness of his wrath should inflict,
as though omnipotence should be as it were enraged, and exerted, as men
are wont to exert their

You're right about the Kenwoods. I just sold a TS-530S that I bought
new in 1983, and it used 6146B's. It was rated at 220W PEP Input,
about 10% higher than the 6146/6146A rigs. I don't recall how the
finals looked. I opened the case only one time, to enable the WARC
bands. Boy, that was one fine radio! I used it for only 7 ARRL-log
pages worth of contacts, mostly some skeds with relatives and playing
around during contests. I kept it in a zipped up bag that you buy

pillows in. When I auctioned it, I packed it in the original double box with the styrofoam inserts, and it looked brand new. I knew that I would never be able to repair it myself, since it was a hybrid mostly transistorized rig. So, I let it go, and bought an HW-101, and got my Drake 4B line out of storage.

By the way, Glen Zook, K9STH is an authority on the 6146 family. Check out his site at <http://home.comcast.net/~k9sth/>

>
>RG
RG,
I had the DX-20 as my first rig, and it used the 6DQ6. My second rig,
for which I have aquired a duplicate, is the HT-40, with the 6DQ5.

I live in dread of the day that my T-4XB's finals give out. A matched
pair(mandatory!) of original spec 6JB6's is going to cost a heck of a
lot more than $40! The well-documented 6146 conversion is always a
possibilty, although I don't know how well those chinese tubes will
hold up.

Hmmm...I think I told you in another post that I sold my TS-530S
because I wouldn't be able to maintain it, and therefore I went back
to the Heathkit HW-101 and the 4B line...I'm contradicting myself.
Soon, I'll be sending myself nasty flaming posts ;)

Howdy... Switchcraft made those plugs. The Drake spare parts list shows the 230 (.206 dia. black handle/cap) for the mike and the 229 (.250 dia. red handle/cap) for the key/headphone. I've seen them in parts catalogs (Allied or was it Mouser) and I've seen them listed on eBay. They could be used on Collins but they were ideally suited for the Drake gear having the jacks on the side of the rig.

This is the Switchcraft spec sheet for those plugs:
http://www.switchcraft.com/products/jack-137.html

Hi Ted... I lost myself in this thread... well, that's how it all got started. I was going through my Drake stuff when I looked at my tube spares; sets of 3 matched 6JB6's for the TR-4. The price I paid at AES for each set back in the late 70's was marked on the packages---$18.00 and they are going for nearly $100 today! My mind wandered to the 6146's and the question was born---why didn't Drake use the 6146's instead of those sweep tubes? Decades back those 6146's seemed to be everywhere. Heck, I had a bunch that I was given not to mention what I collected here and there. You are right, the matched 6JB6's cost more than the $20 I quoted but I tried to be fair and compared a single 6DQ6 to a single 6JB6. Looking at what a matched set of 6JB6's cost for my TR-4 they seem closer to $30 each (the last time I checked).

Through the course of conversation I began to feel that Drake used those tubes to increase their profit margin since they were available nearly surplus (no longer used in TV designs) at $0.50 apiece (based upon what I read somewhere). I tried to find the relative quantities produced; 6JB6's compared to the 6146. I think we ended up somewhere that there were many more 6146's made than the 6JB6's---so the price... classical economics rules. If the tubes used in the Drake gear were 6146's, more than likely they would go for around $10.00 each (I've seen them go for around $6 to $7). Its interesting to reflect that with all the amateur rigs out there that used the 6146; from the Ranger I and the KWM-2 (and who knows what else) maybe ending somewhere with the Kenwood gear of the 80's, the price of the 6146 has effectively escaped the price escalation that seems to have affected the 6JB6.

Anyway, I found some interesting articles on the web; QST (1980) by Doug DeMaw and in 73 (1975) by a young Dave Ingram (now of CQ magazine). The articles present design information related to the use of sweep tubes in rf power amplifiers. I'm sure the boatanchor group would like reading through them, besides, you just can't miss Doug's 2-meter amplifier using two 6JB6's!

http://www.thermionic.org/sweep.html

Thanks for the link. Yes. that article on the family of 6146 tubes was informative.

RG, I'll definitely check out that site. Yeah, it was a mystery to me. The Japanese radios I knew of , primarily the Yaesu FT-101 that one of the guys in the K6NCG club station at Treasure Island in San Francisco bay used sweep tubes, I'm pretty sure the Henry (Trio) rigs used them; and I don't know about Swan, which was popular then as a low cost alternative. Yet Heathkit used 6146s in their premier line, the SB and later, HW-101 rigs.

I have heard stories of sweep tubes melting down under sustained load, but I have a true story regarding the 6146. When I was stationed at TI, we lived in Navy-sponsored housing in Oakland. The landlord of the apartment lived just underneath us on the 1st floor. They agreed to let me put up one of those Miniproducts half-wave triband verticals. One day after a QSO I was turning away from the rig and simultaneously turning the SB-100 off. About 45 minutes later, the landlady came up and asked if I was on the air, because their tv set was blanking out constantly. I said that I had been, but I was off the air now. then I walked over and checked the rig...I hadn't turned it off 45 minutes earlier, I had switched it to the "Tune" position! I had been generating full carrier output...as they say, a brick on the key. Now that's rugged. I finally replaced the tubes with new 6146W's 8 years later, but only because they were given to me by a friend. I still have the 6146Ws; I'm going to put them in my HW-101 sometime this week, while I have the rig opened up to shift the carrier point to the center between USB and LSB.

73,
Ted KX4OM

There were a couple of them on eBay last week, but I missed out on
them. The straight-on Collins plugs definitely dictates how you
arrange your Drake equipment.

Yea... I had a pair of 6146W's given me too---in the white box with the
black print on the side ;-). That was one of the points of conversation in
the thread, those 6146's and 6146A/B's were everywhere.

Treasure Island... most likely in the 1970's. a few years earlier had me at
Hamilton AFB... I used to hang around at AG6HQ/K6FCT. There is a Microsoft
Groups page 'HamiltonAFBHistory' at

http://groups.msn.com/HamiltonAFBHistory

After the base closed the MARS station became Navy with the call NNN0VNV
http://www.qsl.net/k6bw/

I need the 6 digit dispaly that Lowe uses in their HF receiver HF-225 Part No. 021-1261 6 digit x 12.5 mm LCD, 50 pins, or a cross to a US available part number. Or if anyone has a non-working HF-225 they like to sell I'm interested.
tnx

FS: Collins ART-13B AM/CW transmitter in very nice clean condition. I have a power supply for it that isn't checked with this transmitter. I got the supply from someone who used it for their ART-13. I have the original manual for the transmitter as well. The "B" version was very late and I believe that this unit was used in civil commercial aviation after WWII as it has all the updates. If I don't sell it here, it goes to eBay. Price is $800 for all.

I am not at all familiar with the TS-500 ,but ,I think you need a plate relay ,as used in Vox circuits ..it will be high resistance like 2 to 10 Kohms..Usually they have a circuit to adjust the "pull in " point.. I also believe you can find one at Fair Radio Co. Sorry I don`t have the stock # ..GL 73 Harold W4PQW.

Thanks Harold

I have a relay with a 5k ohm coil but according to my calculations the plate dissipation of the valve is 1.7W and with this plate voltage it would require near 4W for this relay. To match the power dissipation of the valve I would need a relay with a coil resistance of 13k ohms. Is that possible, did they make relays with such a high coil resistance, the gauge of wire must have been very fine. I will contact Fair Radio and ask their advice and see what they have in stock. The relay has 4 double-pole change-over contacts which is quite a complex rewire job, so a drop in device would be great!

Best 73. Thanks for the swift and helpful reply.

1509. HW-101 Manual

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-07 10:49:14 UTC
From: Jim Barnard <jbarnard@ftc-i.net>
Message-ID: <d33371$4pjs$1@news3.infoave.net>
Source record: 18698

I am starting the restoration of a Heathkit HW-101 that has been in storage for around 10 years. It is the dirtiest radio I have ever attempted. To get it really cleaned up, I am going to have unassemble about 50% of the radio. Also, the radio was very poorly built originally. Does anyone have copies of the assembly part of this manual they could share with me?

Thanks, Jim Barnard

1510. FS Equalizer Amps

I have for sale four DuKane 10460A vacuum tube equalizer/amplifier units. The tubes include 5881s, 5U4Gs and 12AX7s. I have no idea whether they work. They appear complete, except that I have removed the knobs from one unit (they are Dakaware and match some of the knobs on the older Collins A-line rigs). I am asking $15 apiece--or all four for $50--for these units, but they are fairly heavy and I will not ship them. They can be picked up in the metropolitan Washington D.C. area.

(deleted personal email and phone as a courtesy to those involved)

Military Radio Collectors Group - 2005 Meeting
Official website: http://www.syzen.com/milradio/

The tenth annual meeting of the Military Radio Collectors Group will be held at the NCO Club, Camp San Luis Obispo, California, May 6 to May 7, 2005. Events will formally begin at 0700 Friday morning, but early arrivals are welcome on Thursday afternoon, May 5. Registration will be open at 1800 Thursday evening. Those planning to attend should contact Lynn Fielding at or .

THOSE ATTENDING MUST SHOW AUTOMOBILE REGISTRATION, PROOF OF INSURANCE AND IDENTIFICATION AT THE FRONT GATE! For more information and registration forms go to:
http://www.calguard.ca.gov/cslo/Veh_Pass_rules.htm

Secured areas for equipment operation and display will be available inside the Club and there is ample room on the surrounding grounds and the campground to accommodate outdoor activities. Suggested operating frequencies during the meet are 3870 kHz, 3885 kHz and 7293 kHz for AM, 3996 kHz and 7296 kHz for USB, and 29.6 MHz and 51.0 MHz for FM. The use of 146.52 is recommended for simplex operation.

Friday Program

Friday will be devoted to equipment setup and display, operating events, technical presentations, equipment judging and informal gatherings in and around the campground. Special activities will include fox hunts on six M, (51.0 MHz), and 3885 kHz.

Saturday Program

The equipment exchange will be held from 0730 - 1100 on Saturday morning with a barbecue (advance sign up required) following at noon. The business meeting will convene at 1300. Event clean up will commence at 1500.

Presentations

Robert Burger, WB6VMI Topic: The GPT 10K Transmitter
Bart Rowlett, WB6HQK Topic: Evolution of the Field Telegraph, 1903 - 1965
Ludwell Sibley, KB2EVN Topic: The "Gibson Girl" Lifeboat Radio
Bill Feldmann, N6PY Topic: Restoring the Hallicrafters SX-28 Receiver

A time schedule will be provided at registration. Anyone else interested in providing a presentation, demonstration, or field exercise should contact Dennis DuVall at

Food and Drink

Coffee and tea will be available during the event for a donation of 50 cents per cup. Bottled water and soft drinks will be available for 75 cents each. Continental breakfast items and juice will be available on Friday and Saturday mornings for 50 cents each. Lunch on Friday, dinner on Friday, and a lunch on Saturday will be available with advance sign up.

Lunch Friday - Barbecue Tri Tip Sandwich, baked beans, cole slaw, and dessert by Wild Bill's Barbecue. Approximate cost $11.00

Dinner Friday - Appetizers, Chinese Chicken Salad, Antipasto Salad, Green Salad, and dessert. Approximate cost $8.00

Lunch Saturday - On Site grilled Barbecue Beef, Chicken, assorted side dishes, and dessert. Approximate cost $10.00

Those planning to attend and those wanting to participate in the on site meal options should reply by April 18, Contact Lynn Fielding at or leave a voice mail at

The bar in the club may be officially open during certain periods and drinks may be purchased at those times. THE CONSUMPTION OF ALCOHOL IN THE CLUB OR ON THE SURROUNDING GROUNDS AT ALL OTHER TIMES IS PROHIBITED!

Video & T-Shirt

Bob Heusser, K6TUY, plans to record the event this year. A T-shirt for the tenth annual meeting of the Military Radio Collectors Group will also be available.

Accommodations

Tent and car camping facilities are available on-site adjacent to the NCO Club. Full RV hookup are available for $14 and electricity and water only are available for $12 per night. Billeting is available at the camp on a space available basis for $21 per person per night. Hookup and billeting reservations can be made by calling

Finances

There are no admission charges for this event, but a fair share contribution of $10.00 is requested from each participant to cover costs.

Directions

Camp San Luis Obispo is five miles west of the city of San Luis Obispo. From the 101, take highway 1 west toward Morro Bay. Turn south (left) from Highway 1 to enter at the main gate. The NCO Club and the campground are on the west side of the camp. Direction signs will be posted along the route

from the main gate to the NCO Club.

Points of Contact

Dennis DuVall, W7QHO

Lynn Fielding, KE6JZD (Registration and Logistics)

Bart Rowlett, WB6HQK

Rian Robinson, W6SUV (Equipment Judging)

Hank Brown, W6DJX

1525. More on Radio-Mart !

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-08 15:21:28 UTC
From: MAILFRMPA@AOL.COM
Message-ID: <1112973688.556136.304780@g14g2000cwa.googlegroups.com>
Source record: 18714

Despite what I read here, I bid on some Ebay items offered by Radio-Mart. I thought I was safe as both items were "Mint" in his descriptions.

First, an NC-270 w/manual, Mint. Paid about $270, surely a mint price. It arrived yesterday in certainly less than mint condition. To wit, Case scratched, front panel chipped, "eyebrow" bezel corroded, knobs were so groddy tht the color could not be distinguished, fold up front case stand scratched and bent. On a 1-10 scale, I rate a 7.

Second, a Yaesu FT-401B, Mint, Restored. Paid $180, a good price. Arrived single boxed, in bubble pack. Box was reinforced with plywood. The front panel of this 70 lb rig easily popped the one layer of bubble wrap and bent the main tuning spinner. Rig was filthly and non-operational. I spent, no joke, 7 hrs cleaning this rig. The pc boards are still messy. Found a jumperwire on the receiver board broken. This "Mint" rig an 8 outside; inside, a 4. In addition to the grunge, it is missing 2 tube shields. I have not had the time to test for operation since repair.

How does he get ANY positve feedback? He has some Collins gear that sold for thousands of dollars. If they were as inaccurately described as these, the buyers must be livid.

He has offered refund, but I have $70 in shipping one way.

1526. Re: More on Radio-Mart !

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-08 15:30:25 UTC
From: Ron <wa0kds@yahoo.com>
Message-ID: <4256A428.8000108@yahoo.com>
Source record: 18715

So you are a dissatisfied customer and your only recourse is to give Radio-Mart some bad feedback - are you? I believe it is your duty to give this guy some bad feedback but you are setting yourself up to get some back in return. Other than out and out lying this guy seems to be doing quite well via eBay and people that keep on buying from him. He seems to also have a never ending supply of equipment. I sure hope other enterprising people don't starting using this guy as an example as to how to make money on eBay. I expect that if Radio-Mart actually tried to be honest in his descriptions he would still do quite nicely via eBay.

Life goes on,
Ron WA0KDS

My question is, if he knew this guy had a bad reputation, he read many bad comments - WHY THE HELL did he buy off him? Makes no sense to me..... If I read a ton of bad messages about someone - there is no way in hell I'm buying off them, I don't care who they are.

In the end, I have to agree that if you knew about Marty and then went ahead and did business with him, you shouldn't be surprised at the outcome. I buy and sell on the net and have been watching this person as a diversion. After reading his bad feedback and all the rest, I can't say that I would knock down his door looking for a great deal. Mint..... heh heh heh...
rgds,
Mark S.

1535. Can't receive when Dentron amp is inline

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-09 02:54:06 UTC
From: "Chuck W." <cwyatt@w3minds.com>
Message-ID: <1113015246.444593.257260@o13g2000cwo.googlegroups.com>
Source record: 18724

I hope this is just a dumb question and not some complicated problem
that I just bought.

Just picked up a Dentron GLA-1000. Filaments come on in standby, (1100
volts) and the t/r relay seems to be working. However when I put the
amp inline patched with coax between my transceiver and my antenna, I
lose reception as if the receiver can't "see" the antenna anymore.
Even if the amp is turned off. So I won't even try and tune the thing
of course!

Thanks for any suggestions,

Chuck

Unplug it, take it apart, short the relay terminals with a jumper. If
the receive comes back, take the relay apart and try to clean the
contacts with an eraser lightly, try to keep them silver polished. Or
replace the relay.
Good luck, 73 Chris VE3NGW/W4 Florida

Invitation to Participate in the 2005 International Museums Weekend
---

* The fifth 'International Museums Weekend' special event will be
taking
place this year on the weekend of 18 and 19 June. Everyone is welcome
to
join in from their local museum for this very enjoyable and friendly
event.
The organiser, Harry, M1BYT, asks that all those intending to join in
should register their museum. Registration is free of cost via the IMW
website http://ukradioamateur.org/imw/

Spring is here in the Carolinas and it's time again
for our Spring Swap Meet at Spencer.
Saturday May 7th from about 8AM until around 12noon.
Admission is FREE, sellers pay just $5.

You can visit the Spring Swap Meet web page
at http://cc_awa.homestead.com/Spring.html
for details including driving directions.

If you've never attended the Spencer meet
it's a great place to bring the family since
it's on the grounds of the North Carolina Transportation Museum.
which has lots of vintage trains, antique cars, etc.

Come spend the day, radios in the morning and
trains in the afternoon.
But don't show up in the middle of the day expecting
to see any radios for sale.
These Saturday only events start early, and end usually
before 12noon.

Hope to see you there.

Ron

IF you find a junked Heahtkit IM-18 (or earlier of this series) VTVM ... it
had a transformer with about those ratings.

Source record: 18730

Hello, Chuck

Put an Ohmmeter between the center pins of the input and output
coax connectors of the amplifier, and check for continuity.
If open, suspect the "back" contacts of the T/R relay need cleaning.
A bit of rubbing alcohol on an index card, pulled
through the contacts while you carefully hold them shut
should clean the contacts. Don't use an emory board
or sandpaper. A burnishing tool is also good, if you can find one.

Also look at the coax jumper cable you use between your rig
and the amplifier. Look for continuity between center pins,
and no short across the coax. (It is easy for a strand
of the coax shield to short out a connector, if the coax braid
wasn't tinned before assembling the PL-259.) Flex the coax
while you are doing the ohmmeter check, to look for
an intermittant short.

73,
Ed Knobloch

a white business card works well also... I normally cut the card into 1/4 or 3/8 inch wide strips. Then run the card strip back and forth between the closed contacts (use you finger, but be fairly gentle). Inspect the card strip when your done. If there is any color on the card from the contacts, start over from the top, until the card comes out clean. Do not use sandpaper or an emery board!!!!!!!

Here is a dumb caution -- but:

Don't forget that there are lethal voltages inside that unit. Furthermore, a good jolt may be present even with the Amp unplugged, since the caps may be holding a charge.

At least for some - anyway! As much as I used to like E-Bay, I'm starting to
get a bad opinion of it with some recent things I've seen in a few places.
The sad part is, though they may not be "the" only game in town, most
respect it as such.

1551. National SW-3 Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-10 23:58:30 UTC
From: Bill M <dontspamoleexray@coqui.net>
Message-ID: <115jfd84qvjbo27@corp.supernews.com>
Source record: 18740
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono

Hi,
I'm cobbling together an SW-3 with some "found" parts. The chassis is the later model ACSW-3 with 58/58/27 tube line up and the change of the RF gain to the cathode of the RF Amp stage.
It shows no evidence of ever having had the internal shielding partitions and the various photos of this model on the web that I have found seem to be the same.
However, I just noted one on ebay that looks the be "almost" the same model ACSW-3 and it DOES have the partitions. I can't see how they are mounted so I don't know if I'm looking for the right missing holes in my set. Chassis and cabinet came from different sources and neither are 100% mint.

Can anyone clear this up for me? Did they do away with the partitions at some stage of production? If not, can someone provide me with info of how they were attached to the cabinet/chassis and I'll make repros?

Thanks,
Bill WX4A

1552. Need help trouble shooting PLL noise on a Tempo 2020

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-11 02:36:50 UTC
From: Defnroc04595@aol.com
Message-ID: <4259e2af.20995930@127.0.0.1>
Source record: 18741

I'm in the process of restoring a Tempo 2020 (Uniden 2020). I have
everything working again, but there is one small bug left to swat.
When listening to the receiver I hear a slight gurgle or blip every
few seconds in the receive audio and in the transmitted signal.
I took a general coverage receiver and zero beat the different IF
frequencies in the receiver. All the IF carriers are gurgle free
except the 6.x MHz IF signal generated by the PLL board. The gurgle
or blips in the IF signal generated by the PLL board match the ones I
hear in the receive audio in both time of occurrence and sound. It is
not constant, but it may happen three of four times within five
seconds.
I tapped around the circuit board with a pencil, and noticed a
similar noise when I tapped around resistor R812 and C815. I replaced
those two parts, but it did not make any difference. D807 (part #
mv201) is a varactor diode in the same vicinity, and I'm suspicious of
it. Any helpful suggestions would be appreciated

There is a schematic of the Tempo 2020 PLL board on-line at;

http://www.shadowstorm.com/cb/schematics/Tempo-2020-pll-board.jpg.

Thanks,

-Rea

1554. Do DSPs (digital signal processors) really work?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-11 02:45:02 UTC
From: straydog <advocacy@sdf.lonestar.org>
Message-ID: <Pine.NEB.4.61.0504110234040.1747@sdf.lonestar.org>
Source record: 18743
Cross-posted to: rec.radio.amateur.boatanchors,rec.antiques.radio+phono,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.policy

A ham friend told me that he heard that DSPs really work at least a little bit. He doesn't have one and neither do I (although many of the newer and more expensive rigs have them, and there are one or two outboard DSPs that are available that can be added to older rigs in some ways). I don't know all that they can do (auto null heterodynes? auto noise reduction [what kind of noise reduction?]? audio enhancement [or audio bandpass shaping] of some kind?) but if static crashes can be really removed or attenuated, that would be of use to me. Auto null of heterodynes would be nice on those occassions when tuner-uppers decide to tune up on my frequency in which I am already in two way contact with others (on ssb phone). And, maybe there are some other useful characteristics I don't know about. But, are these really effective? For example, a 20 db heterodyne null is not much. Nulls have to be about 50-60 db to be useful.

I'll take any kind of comments, suggestions, refernces to testing, or personal experience, pro & con recomendations, ...anything...

There are some good demos at
http://www.radio.bhinstrumentation.co.uk/html/demonstration.html . I have a
cheap Radio Shack DSP40 that performs at the lower end of the scale as far
as these go. It does a remarkable job of multiple heterodyne reduction and
selectable audio passband but its noise blanker is next to useless and it
does not do noise reduction other than through selectivity.

The performance of a DSP is very dependant on the software it runs
under.

I've had two personal experiences with Ebay. 1 buy, and 1 sell. Both
bad. And a friend's fiancï¿½ had her credit card info stolen from Ebay,
and the card was maxed out by the lowlife that stole it. Offshore to
boot - what a mess!

Of course Ebay's stock answer is that she could give the guy negative
feedback!!!!! HAR! The answer to all the world's problems is apparently
negative feedback.

The fatal flaw in their scheme is that they are "not responsible" for
anything. I suspect eventually someone is going to do huge fraud on
their site, and then the courts may decide otherwise, regarding
responsibility.

Now its time for the apologists to chime in about how they've *never*
had a problem - thousands of transactions and not been burned once!

But what we are hearing these days suggests that the rosy picture these
sellers paint is not so accurate.....

If they didn't work, none of the current military radio systems would be any use - they all use DSP! I've designed an audio processing DSP system using one of the new dsPIC devices and a codec - just two small chips. The codec includes a mic pre-amp and headphone amp.

First learn how to use the system. There is no way to have credit card info stolen unless you give it to someone. NEVER. Yes around a 1000 transactions here and only one that went bad. I buy and sell almost everything on eBay. Automotive stuff is about the worse people to deal with. HAM are the most honest other than the one named Radio-Mart. Feedback works if you use it correctly. If you are buying from someone ready the feedback even the positive ones. You will find that some positive feedback is really not that positive at all. Don't bid on someone item if you have a funny feeling after reading the feedback.

Just have FUN,

I've not had a lot of opportunity to use DSP for Amateur
applications, however I have used it in the Icom IC-718 for Civil Air
Patrol applications.

Several of CAP's 4mHz frequencies suffer from foreign hetrodynes
and other ectopics. The DSP has been over 90% effective in making the
channel "usable".

Hello all,

I got a RACAL MA.295 antenna change-over switch I would like to use.
It has on the front 3 N connectors labeled "antenna", "receiver" and
"transmitter" and a fuse holder plus 2 lamps (power on and transmit).
Inside is a transformer plus some diodes, a relay and a big coaxial
relay.
I do not want to rip up the wiring, so I was wondering if somebody
happens to have documentation of this thing.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday April 17th 2005
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and

Of course they work. How well, as Michael points out, depends on the
software.

> are available that can be added to older rigs in some ways). I don't know
> all that they can do (auto null heterodynes? auto noise reduction [what

DSPs can be programmed to do almost anything, but in amateur radios, they
generally are used to reduce noise and null hetrodynes.

> of some kind?) but if static crashes can be really removed or attenuated,

In general, the point of DSPs tends not to be to remove static crashes.
Some of the newer noise blankers are, in fact, processors that might be hard
to distinguish from DSPs. They tend to do a very good job on pulse noise,
but I haven't tripped across any that are even decent on static crashes.

> really effective? For example, a 20 db heterodyne null is not much. Nulls
> have to be about 50-60 db to be useful.

Remember, these things are software rather than filters. The stronger the
heterodyne, the easier it is for the software to recognize it.
Unfortunately, it's not magic. A really strong heterodyne is going to be
driving your AGC and perhaps overloading some amps in your chain, so it
isn't like it magically disappears with no other effect. Still, very often
the DSP can make life more pleasant in the presence of lids.

..

Two bad experiences are not enough to form a conclusion. If you lost your CC info using ebay, then you are more than a little bit naive in the way you use the internet. But enough on that.

The biggest problem I see with the feedback system is it isn't blind. If you give negative feedback to someone like Radio-Mart, he will give negative feedback to you. I have had a couple of bad transactions where I *should* have given bad feedback, but the ebayer threatened to trash me if I did. My feedback number is too low to accept even one bad feedback.

What ebay should do is make it so that you cannot see the feedback given to you, for the current transaction, until you have sent in your feedback, for that transaction. It would probably be best to make it so that nobody can see the feedback from a transaction until both parties have contributed their feedback. You wouldn't want a bad egg to be able to read your negative feedback from a shill account. To protect against the large number of "zeros", there should also be a counter that tells the number of transactions made vs the number of feedbacks received.

Uh-oh. I'm in a quandry here. I just finished restoring an SW-3 and can't find the coil forms. I don't want to bugger it up by changing sockets.
I checked with Jim Fred and he has none and is quite far behind in already paid orders. He's also the supplier for Ocean State which is the only other source I know of and he says they are out of stock.

I don't think I can afford originals but does anyone have any of the aftermarket types hanging around that they'd like to get rid of?

If Ebay used nicknames for seller/buyer honesty..

% of positive feedback

100% - Saint
99% - Wal-Mart
98 % - K-Mart
97 % - Radio Shack
96% - Street vendor
95 % or less - Ferengi

I think Radio-Mart falls in the Ferengi catagory.

And here for your amusement is the Ferengi Rules of Acquisition.

http://www.dmwright.com/html/ferengi.htm

:)

I have Citbank Master Card. They have a feature on their website where
you can get a "virtual" cc number that references your real cc number
and is good for one transaction only. When I want to charge something to
my cc on the internet or even via phone, I get a virtual number, after
the charge is made, that number is no longer valid. The person you are
dealing with never sees your real cc number.

So, what you are implying is I'm against freedom?

Let me put it this way, if a guy comes apon a crowded
city street, and runs headlong into the street, without
regard for the signals, and gets hit by a car, he might
conclude that it is very dangerous to cross that street.

Yet hundreds of thousands of others with, minimal schooling
in the ways of city traffic, can cross that same city street
without incident.

The conclusion drawn by the ignorant one is improperly formed.
Given the tiniest bit of schooling, he too could use ebay safely.

Now, about that freedom thing: AR15s at 100 paces....;-)

Isn't the effectiveness of DSP critically dependent upon the A/D converter;
its dynamic range, it's number of bits and it's sampling speed?

Re: Peter's comment below; I don't know enough about DSPs to answer. I got a few ideas and notions from all that responded. Me? I was most interested to learn whether any DSPs could do noise reduction of any kind. Heterodyne from lid tuner-uppers would be nice, too, and so would passband width and position.

I did google "DSP & ham radio" and quite a bit came up and it will take me some time to check out enough to figure out if it might be worth chucking out $200+ on a decent outboard unit (I can't justify laying out a big chunk of money on a really modern xcvr with built in DSP just for those relatively rare moments when I have pulse noise, hash noise, or a heterodyne, or someone with spillover from an adjacent frequency), so I need something that works pretty good. One guy said there is no "magic" meaning to me that maybe I should not expect rabbits to come out of hats easily and quickly. My friend with whom I have weekly ragchew ssb QSOs told me that just putting on headphones helped him read me when I was weak and his noise level was high. Also, it helped him a lot when I bought a linear and went from barefoot to four 811As. But, if a nearby QSO starts and thier audio is broad, the spillover can be annoying if they are stronger. Thus, if I could "DSP" a narrower passband and shift the frequency (or at least shift the "knee"), that might be useful.

Regarding efficacy, I remember back some 3-4 decades ago they were coming out with audio compandors that "compressed" 2.5+ khz of audio bandwidth into a signal about 1.2 khz wide, thus saving bandwidth but the gadgets never caught on bigtime and some gossip said that the extra "audio punch" and thus power boost (3 db-ish) really didn't end up doing that much. So, that is one example of a fancy-schmantzy gadget that didn't last long. This new PSK-31 audio jazz is also out there (the box is about $500 ?) and you need one at both ends of the voice QSO and I have not yet heard many of them (the review said that if the signal drops too low, the voice info just stops coming through the speaker, so it has its caveats, too).

Again, thanks to all those who made comments.

Art, W4PON

Hi,
I need the concentric knob pair for an Eddystone 990R - the original light
grey type with brushed aluminium end insert. This pair is the RF/IF gain control knobs.

Have tried Dave Simmons in the UK, but no response to requests.
Also have placed ad in the Eddystone User Group newsletter, no results.

Please remove NOSPAM in return email address

Hello,
I have an ugly, working HQ-145X. The previous users had fat fingers and a lot of the lettering is rubbed off. Also, I don't have the original cabinet. If you have a non-working, clean HQ-145X that you would get rid of, please let me know. I live in northern IL and would pick up within 300 miles (even with today's gas prices). Thanks.
Larry

I learned about a year ago that using one's ID on these newsgroups is very dangerous. Do a WEB search and you will find every post you ever made or every post someone else has made. A good way to find out a lot about a person for good and bad reasons.

EBay is a great place to do business and the Radio Mart's are few and far between.

Now go do you WEB search and tell you what you found. Do it by your name your handle if different and your email address.

Hmmm, will the next analogy be about a woman who was assualted, but it
was her fault because she was pretty, or was wearing a nice skirt?
That's what you're doing here.

It was MY fault because I didn't check out the sellers feedback.

The unspoken statement that goes along with this is that since it was my
fault, it is acceptable for sellers to take advantage of the unaware.

Chuck, Ebay is simply not a good neighborhood. From my personal
experience, and from what I have read and observed, and had related to
me over the years, it is still not a good neighborhood.

That you come up with analogies such as me wearing a t-bone steak suit
(actually that was what my folks did to get the dog to play with me) ;^)
and now the running into the street thing, merely indicates that it is
not a good neighborhood.

Finally, there is an inconsistency in calling me naive after getting screwed on Ebay twice. Seems as if stopping was the point at which I lost the naivete

> The conclusion drawn by the ignorant one is improperly formed.
> Given the tiniest bit of schooling, he too could use ebay safely.

I suppose that with the proper schooling, one could have daily casual sex with total strangers and not get STD's. No thanks, I'll pass.

>Yes, and the AGC system that makes maximum use of the A/D and D/A range.
>See for example the organization of the Ten Tec Orion.

If the DSP system really needs some kind of AGC, then it is a useless
toy :-).

If you have a strong and a weak signal in the ADC input bandwidth and
the system gain depends on the strong signal, then the weak signal is
going to be drowned into the (quantisation)noise whenever the
amplitude of the strong signal is increased.

Any properly working DSP system should be designed in a way that it is
capable of properly converting the thermal noise as well as the
combination of all strong signals in the input.

The only justification for using AGC in front of a DSP system is that
if antennas with dramatically different efficiencies are used. For
instance, if the receiver input is switched between a full sized
dipole on 160 m and a ferrite rod (with perhaps -40 dB gain), then it
is quite acceptable to modify the gain with some kind of AGC, but this
could be handled as well with some antenna specific gain presets.

If the system is working an hour on a specific band with a specific
antenna, you should not need any kind of AGC depending on the actual
signal level. If you need AGC for this, then you are going to have
problems, if you are trying to receive any weak signal close to a
strong signal.

What one really needs are ADCs with many bits, say 24 bits,
sampled at least twice the highest signal frequency to be digitized.
One has to avoid saturation (overflow) else the rest of the
signal gets blanked during the overflows.

No, that is not my unspoken statement. My unspoken statement is that if
you are going to live in this brave new world, you must develop enough
"street smarts" to protect yourself.

>
> Chuck, Ebay is simply not a good neighborhood. From my personal
> experience, and from what I have read and observed, and had related to

To the same extent that ebay is a bad neighborhood, the entire internet
is a bad neighborhood. If you don't develop some "street smarts", you
will be taken advantage of. You can be caught by simply believing what
appears to be valid email from a trusted source. (such as Microsoft)

It shouldn't be this way, but we live in a world where there is both good
and evil, and every shade inbetween. By allowing the internet into your
home, you are allowing the most smarmy of scum to take a try at preying
upon you.

>

I said that your naivete was why you got screwed. You lost your cherry
on ebay. Now, if you are a smart guy, you will put on your learning cap,
and start to figure out what you did wrong, and avoid repeating the mistake.

It wasn't being on ebay that got your CC stolen. It was being too trusting,
and too ignorant of scams that have flourished on the internet.

The mistake you made on the internet, that got your CC stolen, works on the
telephone too!

You seem to want to miss the point entirely. Too bad, it ultimately will
be your loss.

I have found ebay to be a most useful tool for acquiring things I could never
find within a 100 mile radius of my town. Without ebay, I would never even know
they were available for sale. From my exposure to ebay, I would venture that
the bad apples are less than 0.001%.
>
> - Mike KB3EIA -

I will leave you with this one tip: by advertising your call sign, you are
advertising your name, birthday, age, and address to anyone who wants to know.
Up until very recently, your SSN was also in the mix, thanks to congress and
the FCC.

Do you think that is a wise idea?

If you think ebay is bad, welcome to the usenet. Here, there are *no* controls!

-Chuck

Very well done response I can't add much other than even in day to day
personal dealing all the below applies.
Or in other words:

"Wake up and smell the garbage then get rid of it so you can smell the
roses."

Over 1000 deals on eBay with only one bad apple doesn't make eBay any
worse than any other place to do business either ON the WEB or OFF."

I believe in the beginning I did buy something from Radio-Mart and
wasn't that happy but just didn't buy anything else from him and went on
with my eBay life.

I have a R390 for sale. Unit works fine..
Has Both meters.
Cosmetically good.
only thing is that it has a r390a data tag on it.
selling to replace in rack unit with a matching 390a. see pic on website
link below
the r390 is the lighter gray unit.

http://mysite.verizon.net/vzeeiuy2/id15.html

$500
I will not ship.
Located in NJ
I plan on being at the Warminster show in PA on the 1st of May.

>> sampled at least twice the highest signal frequency to be digitized.

The LSB should be less than the band or thermal noise in the _input_ bandwidth, so that it would act as dithering noise. For terrestrial VHF/UHF/SHF systems, the antenna temperature is close to 300 K and thus a noise density of -174 dBm/Hz. Assuming 10 kHz ADC input bandwidth, the equivalent noise power would be -134 dBm. In order to be able to correctly convert a strong signal _and_ the broad band noise riding on it correctly, the maximum signal level at the antenna for 16, 20 and 24 bits would be -38 dBm, -14 dBm resp. +10 dBm or assuming 50 ohm antenna impedance 2.7 mV, 44 mV resp. 710 mV. Not very common values on VHF/UHF.

At HF, the band noise is typically at least 20 dB stronger, so the gain in front of the ADC can be reduced and thus the maximum antenna voltage would be at least 10 times larger, so even the 16 bit converter would tolerate a single S9+55 dB signal.

However, in order to be able recover weak narrow band that would be buried in the 10 kHz broadband noise, quite good linearity is required for the dithering process. The dithering noise properties are also critical, e.g. if it contains mostly impulse noise instead of white thermal noise. You may have to move the ADC LSB deeper into the noise floor, which would reduce the maximum input voltage allowed or require more bits.

>banks of digitizers, all contained in a small amount of chip real
>estate, and all controlled by a small microprocessor.

The exponent is just the gain in front of the ADC and the mantissa is the real converted data bits. If the exponent bits varies constantly, this just reflects the "AGC" control voltage of the preamplifier. The number of mantissa bits is the critical thing for a radio receiver. The mantissa bits must still be able to represent the broadband noise riding on strong signals. In practical terms, the exponent could only be used to reflect the broadband noise and antenna gain on a particular band and remain constant as long as the receiver is on that band.

Of course, if we could get a true IEEE float data type ADC with 24 significant bits in the mantissa and nearly 1500 dB dynamic range, there would not be much problems in data conversions :-).

While the use of floating point formats greatly simplifies range problems associated with multiplications and divisions, it still does not do any good for additions and subtractions, so you still have to watch for repeated additions of very small values to a large value and possibly regroup the repeated small number additions.

Most of the folks doing FP (for radar work, for instance) use a pair
of converters and successive-approximation logic to do scaling.

I'm also going to point out here that there are two different kinds of
DSP systems being discussed here.

First of all there are audio processors, which take the demodulated audio
from the receiver, digitize it, and process it. This is what the original
poster is talking about, and these gadgets work pretty well to deal with
heterodyne whistles. Some of them also work pretty well on impulse noise,
at least better than the noise limiter on an R-390. There is a wide
variety of them on the market, each of which has an audio-speed D/A and
A/D pair. The dynamic range required really isn't very high since the
AGC of the receiver has done all the hard part for you. 16-bit converters
are cheap and plentiful and more than enough. For the most part, though,
these devices are noise reduction units and can't do much about improving
receiver selectivity or reducing passband group delay.

SECONDLY, and a totally different animal, there are DSP systems that
directly digitize the receiver IF, and do IF filtration and demodulation
in the digital domain. They may _also_ do some audio processing, but
the big deal with these is that they now have very sharp IF filters
without substantial ringing, and they have extremely good demodulation
without a lot of group delay problems in general. These systems require
much wider input dynamic range, which is usually accomplished with
prescaling. These can be found built into the latest generation of
communications receiver, although folks like Watkins-Johnson also make
retrofit units that you could hang off your old Hallicrafters if you
don't mind paying a few hundred times what the radio costs.

1617. Re: Need help trouble shooting PLL noise on a Tempo 2020

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-14 13:56:20 UTC
From: Defnroc04595@aol.com
Message-ID: <425e72ec.1380044@127.0.0.1>
Source record: 18656

I fixed it! The problem was voltage regulation from the AVR board
(automatic voltage regulator). The pots (R659 and R653) had oxidized
over time and were making irregular connections. The voltage
fluctuations were causing the PLL board to randomly wobble one of the
IF frequencies (6.3 MHz, 6.4 MHz, 6.5 MHz, 6.6 MHz, and 6.7 MHz
depending on the selection from the front panel segment KHz buttons).
I cleaned the pots on the AVR board with contact cleaner, and set the
voltage back to 5.0 volts and 8.2 volts as specified in the Tempo 2020
alignment manual. The PLL IF stabilized and appears to be working
normally now. The frequency warble in the PLL IF carrier is gone, and
the audible warble in the receive and transmit audio is gone as well.

All that info is readable just by being a ham.

And since a lot of people believe that they can make themselves
anonymous on the internet, try posting something really nasty that will
get the attention of the authorities. Then you will find out the extent
of your anonymity.

That I choose to post as myself is one of those choices that I made a
long time ago. You may choose to think I'm stupid.

Yep, but that doesn't mean one has to make it easy. Control what you
can.

>
> If we don't want our information being out there and vulnerable we
> have to deal in cash only, and only buy in person.

That is a little too luddite for me. Your CC company protects you for
anything over $50 if you let them know right away. Well, that is if you
have a CC, debit cards, check cards, and prepaid CC's carry no protection
whatsoever.

That's true, but suppose that you post as yourself, and you piss off one of the truly obsessive nutcases that lurk on usenet. El'fruitcake would have to search through the thousands of people with the same name as you inorder to find your sorry ass and make some trouble.

On the otherhand, if you post with your callsign, the fruited one can go over to www.qrz.com, and there you are! Smile, for those crimelab guys, ... if you can.

> And since a lot of people believe that they can make themselves

The federal and state governments are the least of your worries. They'll find you if they need to find you. It's the lesser evils that you need to worry about.

> That I choose to post as myself is one of those choices that I made
> a long time ago. You may choose to think I'm stupid.

Nope, just ignorant and naive about the internet. We are all ignorant and naive about something (lots of somethings, actually).

-Chuck

1621. Project rcvrs FS: SX-62 & SX-42

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-14 19:07:08 UTC
From: Al Parker <anchor@ec.rr.com>
Message-ID: <wbz7e.52481$QB6.2843206@twister.southeast.rr.com>
Source record: 18660

Hi folks,
These rcvrs are taking up space that I'd rather use for something of more interest to me these days. I will not ship either, but will be going to the Raleigh, NC, 'fest this weekend and can deliver if anyone can meet me or knows anyone who can do the hauling.
Here's some details:
SX-62 - I have not tested this rcvr, I was told it had a bad power xfmr when I bought it, and I will include what may be a suitable substitute (similarly sized). The previous owner had taken it out of the cabinet, and had taken part of the bezel assy off. The clear glass is cracked, one of the large knobs has a chunk of the rim missing.. It looks to be complete, no major dings on the cabinet. There are probably a few screws missing, no feet on the cabinet. I have $125 in it and will sell it for that.
SX-42 -- I've had this one for several years, but it is untested also. I had the panel painted and silkscreened and the cabinet professionally painted at the same time I did another SX-42. They are in excellent condition. The rcvr is disassembled partially, the panel is still off. All parts & knobs are present, incl. the oft missing bandspread clutch knob and shaft, probably a few screws missing. I have almost $150 in the panel & cabinet work, will sell it all for $225.

You can see pix of the panel/cabinet on the other SX-42, those on this one were done at the same time. Also some old pix of the SX-62.

Steve -

I forgot to mention the Piexx substitute for the TU-79 tone board.
This is likely an easier replacement that the ComSpec board!

Actually, you DID cross-post - albeit inadvertantly. Your latest post went to:

alt.radio.scanner.uk, aus.radio.amateur.misc, rec.radio.amateur.boatanchors, rec.radio.amateur.equipment, uk.radio.amateur

It's the automatic "reply to" action of Outlook Express (which I use) and possibly other mailers. I read it on aus.radio.amateur.misc.

As I say, inadvertant. The deliberate (targetted) cross-post was by the person that began the thread.

Did I personally find your humour offensive? Not particularly. But I always keep in mind the potential audience - particularly WRT age - so I certainly think it was inappropriate in forums of this type.

Unfortuntaely - worst sin - I didn't find your humour humourous. :-(

Interesting, since the HP 608 covers from 10 mhz to 480 mhz. How did he align the receiver below 10 mhz?

Inquiring minds want to know.

thats strange how it cross piosted normally it says"you are not a member of
these groups" and then only sends to the one i am a mmember of,i have not
changrd anything so a bit weird

again though what age its a simole play on words,like the UK Carry on films

i find people and kids wearing FCUK clothes and the music kids listen too
and girls wearing trousers with there bums and knickers hanging out
offiensive sadly we dont do anything about such vulgarity.

so i doubt if many youngsters would find it offensive

if they do then tough shit anyone finds it offesnsive well thats there
problems not mine,i do in thisd world as i want and no one tells me how to
behave or what to do,that i find extremely offensive i am a free spirit i am
not bound by rules and regluations that do not cause real harm.

the things i mentioned cause real hamr and have added to the large moral
decay,my little bit of sacrcasms and wit and double entendre to a target
audience is of little consequnece

Hi,
I need the concentric knob pair for an Eddystone 990R - the original light
grey type with brushed aluminium end insert. This pair is the RF/IF gain control knobs.

Have tried Dave Simmons in the UK, but no response to requests.
Also have placed ad in the Eddystone User Group newsletter, no results.

Please remove NOSPAM in return email address

Wonderful attitude I'm sure!

Actually, people tell you how to behave all the time, and I'm sure you obey - otherwise you would not have your liberty.

It's called society.

I will now up the ante. I do not like this kind of behaviour on public groups. Go out into the street instead and start yelling out your so-called humour and see how people take it. (It is a very similar concept, after all.)

Try having some regard for the other people around - whether using voice, or writing messages. If you don't like this, then expect to find yourself on people's ignore lists.

society stinks anyway
i have little to do with society,people woth aspergers syndrome live in
there own world,whixh is what the word autism means.

i make no apologies for that,i dont and never will accept anyone io consider
to be beneath me telling me what to do

if you dont like it tough luck

its perfectly ok behaviour one has the right as long as its not personal
insults

go out into streetr

ok people wearing FCUK cltohes

people watchiong bib brither/poeople drinking/people smoking/people taking
drugs/girls wearing clothes that hardly cover there boides,going to pubs
anbd clubs underage,the filth is out there.

all i said was on joke now remember you do not own Usenet if you dont like
it,then diont dare tell me what to do

you will come off worse i assure you,imean in terms of mails as any reply
you give i reply back
]

ignore by all means as then i wont reply to your stupid comments will i as
you wont be seeing my reply

so put me on ignore list,very childish of you but go for it

Hello,

Just got a ts 520 supposedly in decent condition. Receive is fine, however, when I go to tune the transmit side, plate and load tuning, there is absolutely no meter deflection. Nothing. I have the SP switch in the back in the up position but nothing. Any suggestions?

1645. Special Events Station, WWII Equipment, April 15-17th

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-15 13:12:28 UTC
From: David Stinson <arc5@ix.netcom.com>
Message-ID: <425FBDBB.1080500@ix.netcom.com>
Source record: 18684
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

On April 15-17th, the Shreveport Amateur Radio Association
will run Special Events Station W5E from the Eight Air Force
Museum at Barksdale Air Force Base in Bossier City, Louisiana,
home of the 8th Air Force. The station commemorates the 60th
anniversary of the last combat mission of the 8th Air Force
over Europe. An authentic SCR-287 WWII bomber radio station
and an SCR-274N station will be on the air,
along with other equipment working all bands.
A beautiful QSL will be sent to stations contacted.
More information is available at:

http://www.k5sar.com/HTML/SEW5E.htm

Authentic WWII SCR-287 Station Operation:
While there will be intermittant operation of the
vintage gear throughout Friday and Saturday, on or around
the frequencies below.
The WWII Bomber radio station, SCR-287, running 70 watts of AM,
will operate officially on 3880 KC on Saturday, April 16th from
6 PM until 10 PM Central time, plus or minus 5 KCs for QRM.

There will be a special endorsement to your QSL for working
the vintage station(s). Please note that WWII equipment is
not YeaComWood; some drift and/or chirp may be expected.
We respectfully request the support of the AM community for
our operation of this event. We will also have a complete
and operational SCR-274N station, as well as a display of
the radios used in ferrying operations by the
Women's Army Service Pilots and Women's Army Corps during WWII.

As time and ops permit, we plan to operate the vintage equipment
on other freqs. Look for us around 1845, 3545, 7045, and 7245
(WWII ended in 1945).
Thanks and hope to work you.

Keep trying,

Obviously you can't write anything relevant, but maybe you will eventually
write something in English.

1648. FS: Drake TR-3 HF Transceiver & Supply

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-15 15:01:19 UTC
From: larryj@teleport.com
Message-ID: <1113577279.522061.213460@g14g2000cwa.googlegroups.com>
Source record: 18687

FS: From a local estate sale, an R. L. Drake model TR-3 HF Transceiver.

SSB/CW modes (maybe AM as well, I'm not familiar with this unit).
Includes the matching AC power supply - I don't have it in front of me
here at work, so I don't know if it's an AC-3 or an AC-4. It did not
come with a manual, but they're available from most of the manual
copying manuals like W7FG, etc. I have not powered it up - I don't know

how long it's been since it's been in use, and I don't have a Variac to

power it up slowly, so I don't know its electrical condition. Cosmetics

are good, and I can email a picture of it later today. I picked it up
with a Drake TR-7 station at this estate sale, but don't plan to keep
the TR-3. $185 plus shipping from Oregon.

End Mike post.

Its all in Google groups.

And I still stand by what I said I did have two bad experiences, she did have her CC info stolen, I still believe that their scheme is fatally flawed, and that they will probably be taken to court eventually about it.

And there is not a shed of doubt that at least one ebay apologist is chiming in.

> That's true, but suppose that you post as yourself, and you piss off

That could happen by a person walking down the sidewalk, or driving to and from work, or simply being at the wrong place at the wrong time.

People are so fearful these days. If you want to live in fear, BMG.

Used the Sylvania 216 for IF sweep and low end tracking with external
counter. TM 11-897 calls out dial accuracy of 0.2% which it meets after
some effort. Band 6 sensitivity is not specified in the TM nor is the RF
amp gain. Rather dead for such a high end receiver and I believe it is due
in part to the second harmonic LO used in band 6 only. Lower bands meet the
TM spec sensitivity.

What the hell does this mean ? Everyone is an individual and thus
should be treated as such.

The guy that had the two bad experiences doesn't have what is called
"common sense."

Not the same at all! The IRL example that would be more appropriate would be walking down the street with $100 bills threaded on a string around your neck, and being surprised when you got held up.
>
> People are so fearful these days. If you want to live in fear, BMG.

Not at all. But I suppose that you are so calm and serene that you don't own any fire extinguishers, or have homeowner's insurance. Odds are good that you will never use either, so why not get rid of them?

Not exposing yourself more than necessary is more like the insurance thing, it's a prudent thing to do, only much cheaper.

-Chuck

1664. WTB: "Tailtwister" Rotator Control Box

Wanted: Hy-Gain/Telix "Tailtwister" Antenna Rotator Control Box (only the control box, not the actual motor/rotator unit). I just picked up a brand-new Tailtwister rotator at an estate sale, but it was missing the control box. If I can't find an actual Tailtwister control box, one from a Ham II, Ham III or Ham IV will work. I know the usual used rotator and repair places have them, but they want way more than I paid for the rotator itself.
Thanks, Larry larryj@teleport.com

Right, Bill! I've no doubt that the majority of Ebay users are fine honest folks.

But they are allowing the bad guys to co-opt their system. And heaven help anyone who dares to criticize ebay! I'm supposedly stupid, naive, and all the problems I've had there are my fault. Two problems there, first is blame the wronged, and second is it's the old the carney/rube relationship in which it is "okay" to swindle a person because they are ignorant of "how things work".

There is a big problem. And from what I've seen posted, it isn't going to be fixed any time soon....

How do you figure that? I've been screwed by many more grinning vendors at hamfests than from ebay sellers and nobody seems to be screaming about trying to clean them up.
I don't think you'll disagree that there's a certain portion of the population who are going to screw other people whether its sitting in church pilfering the offering plate or behind prison walls.
Why would you think that ebay could (or should) have some method of creating an artifically "safe" segment of society? Just how would they go about doing such a thing? Shoot, if you have a solution then I nominate you for Pope.

I see, so, it's ok for you to tar the entire ebay mechanism, and community, because you don't like it, but it isn't ok for me to try and explain why the problems you have faced, are of your own making?

Sounds fair to me.

I think you misunderstood Bill's posting. I believe he was referring to
you (Mike) "painting with the the same brush" all of the users of ebay.

Did you verify that the jumper is in place on the back connector for the
screen voltage for the finals?

Thank you, I get all the help I need from frequent trips to
hamfests and electronic surplus suppliers. Been doing so for 33 years so
far, and I've got no intention of stopping until I am PHYSICALLY unable
to work with the stuff.

If OES is indeed a true "disorder," it's one that I'm proud to be
afflicted with.

BTW, you misspelled 'amateur' as 'amature' in one part of your
write-up. I'll let you find it. ;-)

A variety of HyGain/CDE/Telex/MFJ control boxes for the Ham series of
rotators regularly appear on eBay -
at reasonable prices (takes a bit of patience) - if you want "off the
shelf" - you know that price.

eBay item number: 5766576062

I think it is time for we Boatanchor traders to adopt a code or defination of terms describing the condition of these old jewels..I have never used the term "MINT" or used the term "RESTORED" ..to me Restored means spending $400 on graphic work etc. on a front panel for a 75.00 boatanchor.. I have never seen a Mint 60 year old radio..I guess what I am saying is, I am tired of people buying a good working,good looking old radio and expecting it to not have one blemish..Of course I can put in my own disclaimers, but ,don`t you think that we could agree on a standard that we could all live with? Or "most" all of us could live with..What do you think.. W4PQW

A code/system would be good, but it still falls prey to those "rip off
artists" who don't represent their goods in a faithful manner. I've seen
some stuff marked mint, which well... could have been mint - I suppose. I
seen still others marked mint which were pure trash and better served as
land fill. ANYONE trading/buying used - especially online - should expect
"something" to be wrong, even if very slight in nature. Both parties SHOULD
be honest, fully explaining anything that even looks shady about their
equipment.

Thank you for all of your suggestions. I think it works but there could be a problem with my set-up. I notice that when I tune the rig, if I key down my mic when in cw mode, I get some output (neglegible, but pwr nonetheless) but my swr is off the scale. I have a loaded alpha-delta 40m dipole in the attic fed with coax as well as a standard 20m dipole in the attic. How do I tune the rig then tune the antenna? I do not have a dummy load yet but with my last rig, tuning output was but 3 watts. (A very low power lid I guess, sorry) Now that I have 100 watts, I may need to purchase a roller inductance tuner i.e. mfj-969. Any suggestions welcome.

thanks
Greg

You don't by chance have the swr meter hooked up backwards.

Its a humongous Word file. Over a megabyte. Here's the text but you
miss the nice photo of Brian.

The poor individual above was found hunched over a typical piece of WWII
era gear known as a Hallicrafters SX-28 receiver. Even though heavily
sedated by doctors he managed to crawl several city blocks in a semi
conscious state to the object fueling his neurological disorder. The
stress took a heavy toll on his physical well-being, he may never fully
recover.

What causes the symptoms?
The cause has not been definitely established, although current research
presents considerable evidence that the disorder stems from the abnormal
desire for obsolete electronic equipment fueled by a metabolism of at
least one brain chemical (neurotransmitter) called dopamine. The
individual when seeing or even in the vicinity of a piece of obsolete
electronic equipment will become excited and the impulse to buy (or even
steal in extreme cases) the electronic equipment or apparatus becomes
overwhelming. Undoubtedly other neurotransmitters are also involved.

Is it inherited?
Studies suggest that OES is inherited as a dominant gene that may
produce different symptoms in different people. A person with OES has
about a 50% chance of passing it on to his/her children, however it may
not appear as a recognizable disorder to that extent. In some cases, OES
may not be inherited, and is identified as sporadic OES because the
cause is unknown.

Can people with OES delay or suppress their symptoms?
Postponement or substitution of OES symptoms is a skill that few people
with the disease are able to master. It requires considerable energy and
concentration to inhibit the desire for obsolete or antique electronics
for even a few minutes. Family members, teachers and co-workers must be
understanding and compassionate when this cannot be accomplished and the
individual needs a repair or fix. To avoid embarrassment and ridicule,
in certain social situations some people with OES often try to hide
their symptoms by camouflaging there test equipment and tools. Symptoms

may however emerge more explosively when they arrive home or are able to shelter themselves in private surroundings where they feel more comfortable and have access to the apparatus or equipment fueling the disorder. This phenomenon can create a diagnostic problem for physicians who often do not observe OES symptoms during examination. Some doctors have had the unfortunate experience of having their patients with OES dismantle or test their electronic medical equipment when left unsupervised. Never leave a OES sufferer alone with any electronic device even if it's a modern piece of equipment. Some types of people with OES have what is termed as Valvestate Compulsiveness and these individuals feel that the electron tube is superior to the modern transistor and in extreme cases have been known to try and retrofit all the modern electronic equipment in their grasp in an effort to transform their surroundings to a more primitive technological time.

Is OES a psychiatric disorder?
No, OES is a neurological disorder. Secondary psychological problems (e.g., depression or mumbling Ohms law repeatedly) may however arise from persistent difficulties in coping with the disorder and society's reaction to its unique symptoms. Some behavioral difficulties which may be a part of the syndrome (i.e., Obsesed with Radio Shacks lack of radio related componants, compulsiveness and aggressive outbursts related to electronics in general) can also cause significant adjustment problems. In some cases psychological counseling may be needed to help a person with OES adjust, come to terms with OES and build coping skills.

How is OES diagnosed?
The diagnosis is made by observing the symptoms and by evaluating the history of their onset. No blood analysis, x-ray or other type of medical test exists to identify OES. A doctor may however order an EEG, CAT scan or certain blood tests to rule out other ailments that could be confused with OES. Again never leave the patient alone around electronic equipment.

Is there a cure?
Not yet, Education of the individual, family and friends on the disorder and learning management techniques can help reduce symptoms. Electronic placebos such as replicas of old radios have shown to be ineffective in helping wean the OES sufferer off valvestate and into the modern IC/Transistor technology. Some hybrid electronic equipment such as music or audio amplification designs are showing some promise.

Can people with OES lead normal lives?
Unfortunately No.

Is there ever a remission?
Some people experience periods where the symptoms seem to disappear but it seems more relates to finances than desire to ignore their desiese, others experience a marked improvement after high voltage electric shock therepy. How would a typical case of OES be described? The term typical cannot be applied to OES. The expression of symptoms covers a spectrum from very mild to very severe. OES is an individual and complex disorder.

How is OES treated?
There are several things which can reduce the symptoms of OES for many people, one of which is the wife/husband or significant other. Unless symptoms substantially interfere with a personï¿½s life, spouse interaction may not be necessary. None of the things currently available for treatment of OES will entirely eliminate all symptoms. Instead symptoms may be reduced, sometimes substantially, but they will continue to wax and wane, and they will commonly appear more pronounced during stressful periods.

How many people have OES?
We don't know for sure but recent research suggests as many as 1 in 200 people. Now with the booming internet it's easy to see this behavior and it's effects on those that suffer from this debilitating disease. Certain Usenet news groups such as rec.antiques.radio+phono or rec.radio.amature.boatanchors and vintage electronic websites where these people congregate can be seen and the dialog that emanates from these unfortunate individuals and sites is alarming. Laws are being worked on to shut down these breeding grounds of sickness but on a positive note, it's good to know where these people are at.

Hi all. I been working on my SX-28 and I wanted to give it a little more kick and I ran accross a neat little Q multiplier project in one of my old ARRL Handbooks (42nd 1965) . It uses a 2N1264 or a 2N274 transistor. What do you think about these old types and is there a more modern transistor that would better suit my needs? I posted the artical and schematic over on alt.binaries.radio. Thanks

Why not save yourself the trouble and stick with hollow state. You could add something like this :

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=15051&item=5767383676&rd=1

or this:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4673&item=5767442226&rd=1

instead.

Just a thought :)

Learn not to go to hamfests? Might as well learn to be a monk!

I doubt that very many folks would return to buy from a vendor that cheated them, but there are so many vendors. Some honest, and some not.

Ebay is the same thing, but better, because there is a feedback mechanism, and with a few small changes to the feedback mechanism, it could be extraordinary!

But that is where I entered this thread; advocating changing the feeback mechanism so that *nobody* could see the feedback for a given transaction until both parties had contributed their feedback, and adding a transaction counter, so you could detect bad vendors that purposefully tried to game the system by not giving feedback.

There's a better way to handle that situation - for "unmatched"
feedbacks - make the one-sided feedback visible after 90 days - then all
can see it - PLUS it's too late for retaliatory feedback...

best regards...

Exactly my point. OP suggested that ebay was somehow responsible for making people behave and his opposition suggested that sheep are to be fleeced.
Somewhere in the middle common sense, if not a bucketful of luck, should prevail if a buyer hopes to have a good success ratio of good vs bad deals whether its ebay, hamfests, Walmart or used car lots.
Counting on people who sell things to please everybody 100% is naivete.

I've always found ebay to be very responsive to the demands of its
users. I dont necessarily agree with Randy's solution but there are
people smarter than me making these decisions.
The crapola about it going to hell in a handbag from a clown that has
used ebay two times several years ago is unfounded.
ebay is well obliged to a zillion member user base. Old timey hardware
store methodology is passï¿½.
I don't know how that translates to the credit card of a brother-in-law
of a girlfriend that was used by OP wound up getting
hacked...whatever. You call the 800 number of the card and thats the
end of that. Its 2004.
As much as one should recognize the threats of online purchasing one
should also understand/learn the remedies if a deal goes bad.

Back from the W5E Special Event,
hosted by the Shreveport Amateur Radio Association and
the Eighth Air Force Museum at Barksdale Airforce Base
in North Louisiana.
What a great time! We ran the SCR-287 and SCR-274N
stations on Friday evening to "work the kinks out,"
and it's a good thing we did because there were
bugs to be found. The BC-375 didn't want to neutralize
properly. I didn't get that one fixed until
Saturday afternoon, even though we did log some
contacts on the 287 on Friday. By the "official" time
on Saturday, the rig was working and sounding good again.

The big scare on Friday night was the unmistakable smell
of roasted resistor coming from the BC-348-R,
which then crashed, stone dead.
I brought plenty of spares parts and started
"resuscitation" right away. This receiver had been running
flawlessly for a month (as had the transmitter), but now
three paper bypass caps failed, leaking to short.
This toasted two dropping resistors, failing them *low-Z*.
One 4.7 K-ohm was down to 200 ohms. The real scare was
that these were in the IF plate leads, right through
the hair-fine wire in the IF transformer windings.
The way the receiver suddenly died, I was sure one
of the IFs had gone open, but there must have been an
angel watching over us, because new caps and resistors
plus re-alignment brought it back from the dead.
We put the rig back together, warmed it up for a couple
of hours and it worked flawlessly on Saturday night
into the full-wave horizontal 80-meter loop at 40 feet.

Gripe mode on
Operation during the "official" time on 3880 KC
was, ummmm, "challenging." The AM ops from nearly
everywhere were courteous and helpful and we're most
grateful to them. Nevertheless, the QRM was vile-
absolutely horrible. The biggest problem was a group
down here in "5-Land" that, several years ago, decided
that they were the judges of what modes can and cannot
be used on 75 meters. They camp each night within 2 KCs of
3880 with the specific intent of causing as much grief
as possible for any operation in the AM window.
They make remarks about "ancient equipment,"
radios "so old that the knobs have frozen at 3880 KCs"

and about AM operators who are "too old and feeble
to reach up and spin their VFOs if they don't like it."
These room-temperature-IQ knuckle draggers
have been doing this for years. There is another SSB group
that does basically the same thing on 3898, but they're not
quite as nasty about it. I knew about them and that it
might be a problem, but 3880 was the best of bad choices
within the AM window down here on a Saturday night.
I was hoping that the bad actors would give it a rest
for one night for a veteran-connected special events station,
but no such luck. They performed their usual antics,
a couple of times even coming directly on frequency to
ask long and loud if "the frequency was in use."
Sheesh. To add insult to injury, at 9 PM, one hour before
we were going to officially end the AM try, two "big gun"
AM stations in the North East came down and plopped right on
top of us, ignoring dozens of guys telling them the freq
was in use. Their action effectively ended the AM event,
since nobody- even locals- could get past these guys.
I got the station back up after midnight and moved to the
then-clear 3890 KC and logged a few more before turning in.
The result of all this was that if you didn't have a really
good signal, you didn't get heard. I'm very sorry, guys-
I could hear dozens of stations calling, and I was able to
work some of the weaker ones through persistence,
but there was just no way to pull most of you more distant folks
out from under the few selfish clowns
who insisted on grinding their axes last night.
And once those two northeast AM guys dropped on us, it was over.
Gripe mode off

Nevertheless, we did make 97 contacts with the WWII gear,
including both coasts and Canada.
The guys with the modern rigs worked over 300, IIRC.
I've posted a picture of the WWII gear side of the
operation tent on alt.binaries.pictures.radio
and at:
http://home.mindspring.com/~arc5@ix.netcom.com/w5e/
And in case the previous gave you the wrong impression,
I had an absolute blast getting the old beasts running and
working all of you I could hear. The SCR-274N got in some phone
and CW contacts as well, but our 40-meter CW effort with the
274N was hampered by the Michigan QSO party. The rig was getting out
well into a vertical and worked several states.
We even had two SCR-274N-to-SCR-274N contacts,
as well as one with a fellow running a T-22/ARC-5.
Next time we'll try to pick a less busy weekend.

SARA did a wonderful job creating this event and
I'm very grateful for the chance to contribute.
Lots of good publicity, too.

More later- I need some shut-eye ;-).

On the antique radio forums we make a point of driving home "replace those go***mn paper caps because they are never good". You've been around, Dave, You should know better!
Since this post is only to the BA forum instead of cross-posting to rar+p I can admit that the only old radio out of dozens that I have not been compelled to wholesale recap has been an English Barker 88 which used surplus (at the time) metal cased US war-surplus caps. They all, 100%, passed any test I could give them.
More often it makes sense to yank the old paper jobbies and place giant Orange Globs (for the non-restuffers) ...or in your case, assume they were ok with the resulting consequence.
FB on the expedition's results..

Were you trying to run a net with a BC348 as your primary receiver??

The I.F. is as wide as a gorge! When the band is hot I could never use 348
without the 'Q5er.'

I take your point, Bill, and I once agreed completely.
I've come around to a different attitude when it concerns
military radios with a historic angle. I now try to maintain
the original parts if I can satisfy myself that they are serviceable.
These guys were all tested and had been running without trouble for
some time. Of course, they are going to fail eventually.
I've just come to that point where "change as little as possible
and still bring it to life" has become my stand on these
rigs. I probably should have lowered the B+, as I've done
with other radios, which has helped preserve their original parts,
but I got cocky and overconfident on this one. It was
just pure luck and the grace of God that we didn't lose
an IF transformer. I could have replaced it, but it would
have meant working until dawn, instead of just until 1 AM ;-).

Thanks for the well-wishes. We're planning on doing another,
similar event in a year or so. The museum curator, Mr. Rigg,
was very enthusiastic about our efforts to preserve and
operate the equipment and says he's going to "draft" me to help
restore a B-24 they have. Yikes! ;-).

I understand, but the whole point was to operate the special
event with as close to an actual, authentic 8th Airforce
WWII heavy bomber radio station as possible.
Otherwise, it would just be a contact with a typical 1950s ham rig.
So we announced on the net, on QRZ.COM, in QST
and on the DX reflectors, what we were doing and asked for help.
Most people did what they could to help-out and they were a godsend.
Even with QRM from the few bad apples,
I think we did pretty well.

BUt a wide receiver bandwidth means all the transmitters do not have
to be on exact frequency, something useful for net use.

And back when it was a current receiver, the BC348 would be extremely
useful for that. After all, transmitters were not frequency controlled
with the receivers.

The Houston Vintage Radio Association

---------- ANNOUNCMENT ----------

The annual Alvin Tailgate Meet is set for Saturday, May 14 @ 9 am.
Alvin is 30 minutes from downtown Houston and accessible from Hwy 35 & Hwy 6 via 288.

In addition to the usual antique radio, audio and ham gear there will be radios available from the estate of a local
collector including consoles, tabletops, battery sets, speakers, parts, chassis, etc.

For more info and map go to: http://electrojunk.com/tailgate.htm

Hope to see ya'll there!

I've got a nice, dent free cabinet for a Hallicrafters SX-110.
It has the feet and the paper sticker on the bottom. Its been
painted blue, but the lettering on the back was not painted over.
$10, pick up in Santa Rosa which is 50 miles north of
San Francisco.

I just got a Racal 6217 but the frequency dial needs to be calibrated.
What is the procedure for doing this? What frequency should I place
the dial to do this?

Appreciate your help.

Hi,

A full calibration of the KHz dial on a Racal 6217 is a difficult process,
but seldom needed.

What is the problem with yours? (note, spec is +/- 1KHz at 100KHz markers)

-Chuck

1742. Variable Transformer Dial Plate & Knob Needed

Newsgroup: rec.radio.amateur.boatanchors

Sorry for the cross posts. I'm trying to locate someone.

I'm looking for a ham living in Calgary who was going to align my
Heathkit SB-401/SB-303 combo last year (or was it two years ago?). I
lost the email address and phone number --- everything. He mentioned he
could also align my Cardon "Spitfire" as well (if that rings a bell).
I'd like to ship the pair off for alignment now that it's warm weather.

Also, if there is anyone else who can do this, please contact me in case
I can't find the above person.

Thanks very much.

Hi Reggie,

First, the preselector is very sharp, so it must be tuned carefully.
If you look on the preselector switch, you will see 2 positions marked
WB, which are intended for when you are tuning the VFO onto the desired
signal frequency Once you are receiving the signal, switch the preselector
selector to the frequency band desired, and carefully tune the center knob
of the preselector switch for a peak in signal strength.

Second, there is a calibrator that will give the usual 100KHz reference
signals for checking the KHz knob.

You might not be aware, but the 6217, uses a very strange setup for the
MHz selection knob. The knob actually turns a cap that tunes a VFO that
both down converts the RF to a 1st IF freq, and is mixed down so it can
also down convert the 1st IF to the 2nd IF frequency. This double mixing
cancels out any error in the MHz selection VFO's frequency setting.

Pretty cool!

This saved RACAL from needing the fist full of crystals, and switch contacts
that were used in the R390, yet still gives crystal stability in band
selection.

Hi Reggie,

There is a knob on the front panel called "Calibrate/Fine Tune". It is connected to a 25T pot. It allows you to shift the received frequency relative to the displayed frequency by something more than 50KHz.

The correct proceedure is to set the KHz dial to zero, and turn the AGC switch to "CAL", Detector mode to "0", and BFO tune to "0". Then you adjust "Calibrate/Fine Tune" for a zero beat.

Doing an instrument calibration on a 6217 is a very daunting task. I have done many, and once was quite good at it. It requires (and by that I really mean requires): RF signal generator (HP606), AF signal generator (HP200AB), VTVM (HP410C), frequency counter, noise generator (Marconi TF1106), wave analyzer (HP302A), or better still a spectrum analyzer, Oscilloscope, DVM, RF voltmeter (Boonton 91H), Sweep Generator (1-7MHz, with accurate markers), Logrithmic amplifier (Jerrold 500, 1-7 MHz, or HP7562A).

And further, you need a host of adapter cables for the little microdot(IIRC) connectors that are everywhere in the unit. Depending on the model you have, the back panel will either have BNC (preferred), or SMC connectors all over it.

To make matters worse, all of the tuning slugs have square holes, and they are extremely fragile. If you don't use the correct tool, they fracture and freeze inside the coil forms.

On the bright side, there are only a few failures that commonly happen to 6217's, and they don't require calibration. The first is the germanium transistors in the front end are easy to blow, and impossible to find. NTE used to have some NOS transistors that worked fairly well, and the second is a 1/4 watt resistor that protects the VFO burns out when the capacitors get charged up for the first time after a long period of disuse. The resistor is under one of the little metal plates on the bottom of the receiver, near the VFO's. The symptom is noise, but no tuning. And the third problem is the filter caps in the powersupply. Like all 1960's caps, they are getting leaky by now.

The Racal is incapable of having a dead band. There are no bands!

Propagation might be bad at 10MHz, but surely it would be good at
some point.

Chuck, I followed you procedure and was able to pull it back to within 11 Khz, then the knob quit turning (was turning to the left). I had the radio on 15,000 Khz. Turn the cal knob all the way to the left and all the way to the right and was not able to hear the tone. Then I turned the cal knob back to 14,089 and could hear it, but that's when the knob quit turning. What does this mean?

1757. FS: Old B&K model 440 Cathode Rejuvenator Tester (CRT)

The following old B&K CRT tester is offered for sale.
Asking $15 plus shipping (approx 12 lbs packed) to a US address
from 07042. Thanks for looking.

-Al Schapira, KC2HRH, a.d.schapira@worldnet.att.net

==========
B&K Model 440 CRT Cathode Rejuvenator Tester, in black fabric covered
wooden box, approx 14 x 8 x 5, 10 lbs. Case is slightly faded and
worn at the corners. Inside is clean and fairly good condition.
Has tube tester type meter with Good/Bad and numeric scales.
Functionality unknown, no manual. Includes two umbilical cords with
seven adapters for various CRT bases. Includes original instruction
card inside cover. I believe that this was used by TV shops to
test and "rejuvenate", i.e. brighten, old picture tubes.
Untested, as is.

Hi Reggie,

There are a couple of possibilities, the voltage source for the varicap
that is adjusted by the calibrate knob could have drifted, or the shaft
coupling that goes between the tuning cap and the counter shaft could have
been set incorrectly. To check for proper fine tuning operation, it should
shift the receiver frequency a total of 8KHz when you turn it from one end
to the other.

It is easy to adjust the shaft coupling. It has two set screws, one goes into
a brass shaft, and the other presses on a phenolic sleeve that goes around
the capacitor shaft.

Here is the proceedure:

1) measure the RF voltage out of the 2nd VFO output on rear panel, is should
be >250mv
2) connect a frequency counter to the 2nd VFO output on rear panel. Set the
KHz dial to 1000KHz (up at the high end) The counter should read 3.6MHz

3) set the 2nd VFO to 0000KHz, and the counter should read 4.6MHz+/- 500Hz.
If it doesn't, adjust trimmer C4 for correct frequency.
4) set the 2nd VFO to 1000KHz, and adjust the mechanical coupling for 3.6MHz.

5) repeat steps 2-4 until the ends match. When they do, check each 100KHz
point for correctness. If they are wrong, the tabs on the main tuning
cap will need tweaking (DON'T DO THIS UNLESS YOU ARE REALLY SERIOUS!!).

6) check that the VFO varies from 0 to 8KHz when you adjust the fine tuning
control.

OK, that is the official factory sanctioned alignment instruction for the
VFO. Before you do any of it, check with a freq. counter to see what the 2nd VFO
frequencies are at 1000KHz, and 0000KHz. If you are lucky, they will both be
off by the same amount in the the same direction. If this is true, you just
need to slip the capacitor's shaft coupling. Don't go nuts on tightening the
set screw, it only needs to be snug.

Just out of curiosity, have you tried the BFO check position to see if your BFO tuning knob is really at zero when its pointer shows zero? The BFO can tune +/-15KHz.

Thanks _very_ much. Now I have a handle on getting my 6217E tweaked back
into shape. It would be really good if I could come by a set of the cables
for all the finicky little modules.

Mine's just Really Deaf over most bands, but works sort-of OK on 7 MHz.
I haven't ripped into it, as much out of laziness as out of fear-and-
trembling. I would like to get it going one of these days.

To check its sensitivity, put the receiver preselector in the "WB" position.
In that position, all frequencies are exactly the same. There is no band
switching in a 6217E. The MHz dial just tunes a VFO that is used for both
the first conversion, and then is mixed down to do the second conversion too.
The MHz dial's VFO's imprecision gets exactly cancelled out do to this trick.

The answer to your sensitivity problem is very probably a pair of burned out
germanium transistors in the RF preamp unit. This happens all the time to this
receiver. Try and get the original type, NTE's replacement works, but it isn't
quite as sensitive. It MUST be a germanium!

The receiver has a gas discharge tube and a fuse in the antenna circuit, but
the RF transistors are so sensitive that they pop anyway.

Help!
I need the "crystal selectivity" knob off a Hammurlund HQ-140-X receiver.
It is located on the front face panel on the lower left side of the
receiver.
Any help would be appreciated in locating this black knob!

I have seen some later X's with black knobs so I betting 'ol Oscar
Hammarlund let a few out of the factory that way. HQ-140X has the butt ugly
round meter.

Original later model Hammarlund "HQ-140-XA" knobs ARE black. It matches the
black square "S" meter.

Either way, that fluted knob will be a bugger to find...

I have some old info here on aircraft receivers - perhaps transmitters as well. I'm pretty sure they were covered in very early "Sams" Photofacts. I'm talking WAY BACK. Can't recall brand name at moment.

Is this the 6217 that sold a week or two ago on Ebay? If yes, that seller claimed the receiver was in good condition and working properly. It does sound like you need to learn the subtleties of operating the RA6217, but on the other hand if this is the same item that was representetd as being in good shape, perhaps the seller should be drawn into the conversation?!?

Also a junked GR-64 Heathkit Shortwave receiver is close, but the filament output is 12.6 V. I used one to make a 90VDC/2VDC battery eliminator for an old 1936 farm radio - works great.
I imagine alot of the Heathkit signal generators, signal tracers, etc.. would have similar transformers - you could check specs of online manuals then zero in on your exact needs.

Here are a some items for sale. Prices do not include shipping. I am
open to reasonable offers. I will ship overseas. remove"_nospam" to reply.

Homebrew HBR-15 Receiver.......$550 plus shipping
This is a beautiful homebrew 15 tube AM-CW-SSB receiver. It uses plug-in
coils and covers 80-10 meters and it has an additional set of coils
which look like they may be for 6 meters. It uses three coils per band
and It has all of the coils for 80-6. The box shows the coils. The 40
meter coils are in the receiver. The construction and wiring is is very
well done and the National PW dial makes for very smooth tuning. I have
had this in my shack for the past few weeks and used it to listen 40
meters. Their are two empty tube sockets near the front of the receiver
which I believe are for mechanical filters which were not in the
receiver when I got it. It plays very well, has nice sounding audio on
SSB and AM and is quite impressive for a 40+ year old homebrew receiver.
More information on HBR receivers and documentation may be found on the
HBR Receiver Web Site at http://www.qsl.net/k5bcq/HBR/hbr.html

http://members.cox.net/radiostuff9/hbr_1520.JPG

National RAS HRO Junior Receiver Coil Set and Box.....$350 plus
shipping
The coils are as follows: 1 - 190-450 kHz, 4 - 2-4 MHz (80/75 meters), 5
- 4-7 MHz, 6 - 7-14 MHz (40 and 30 meters)
and 7 - 14 -30 MHz (20, 15 and 10 meters). The coils and wooden box are
in great shape. All coils work except coil 1 which has an open.

Hallicrafters SR-42.............$75 plus shipping
A separate transmitter receiver that puts out 5-6 watts and covers
144-148 MHz. This is a crystal controlled radio that also has provisions
for the HA-26 VFO It will probably will work with other VFO's with an 24

MHz fundamental frequency. The transmitter uses 24 MHz crystals and includes two crystals for 145.14 MHz and 146.52 MHz. I used this for a while with the HA-26 VFO to check into our local 2 meter AM net. I recently obtained a Lafayette 2 Meter AM rig so this is surplus. The unit works well and has good audio. It does have some scratches and spots where the paint is missing. Includes the microphone, power cord (often missing) and a photocopy of the manual.
http://members.cox.net/radiodx3/hallisr42.JPG
http://members.cox.net/radiodx3/hallisr423.JPG

Heathkit IP-32 Variable High Voltage Regulated Power Supply.....$100 plus shipping
This is a variable high voltage supply. Here the specs: Output: * 0-400 volts dc regulated and 0-100 ma continuous, Bias voltage is 0-100 volts DC at 1 ma, Filament voltage is 6.3 volts at 4 amps. This unit is in excellent condition and works well. and has a new pair of 6L6GC's installed. Included is a partial copy of the manual.
http://members.cox.net/radiostuff9/heathit32.JPG
http://members.cox.net/radiostuff9/heathit322.JPG

Electro-Voice EV-621L Dynamic Desk Microphone.....$65 plus shipping
Low impedance desk mike. Tested and working, the mike is in nice shape with a few minor scuffs.
http://members.cox.net/radiostuff9/ev621l.JPG

James Millen Frequency Meter Set I-129-(B) (Wavemeters).....$65 plus shipping
Military set of four James Millen wavemeters covering 1.5 to 40 MHz. This is the Signal Corps U.S. Army version and the box says manufactured by Munston Mfg. and Service. The wavemeters were manufactured by James Millen. These are in excellent condition. The wooden carrying case has the callsign of a previous owner. Here are the frequencies of each wavemeter:
*Meter No. 1: 1.5-3.5 MHz, *Meter No. 2: 3.5 - 8 MHz, *Meter No. 3: 8 - 18 MHz, *Meter No. 4: 18 - 40 MHz
http://members.cox.net/radiostuff9/wavemeterset3.JPG
http://members.cox.net/radiostuff9/wavemeterset.JPG
http://members.cox.net/radiostuff9/wavemeterset4.JPG

Quantity of 2- Price Electric Antenna Change-Over Relays.....$50 for the pair each plus shipping
These have N-connectors and are extremely well built. I believe they are VHF/UHF relays
http://members.cox.net/radiostuff9/uhf_relay.JPG

Thanks for looking.

1781. Hallicrafter S-40B Power Transformer Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-21 04:04:59 UTC
From: "Steven P. Burrows" <spburrows@cox.net>
Message-ID: <MDF9e.3514$lz1.2504@lakeread01>
Source record: 18370

I am restoring a couple of S-40B receivers, and I am interested in finding a replacement power transformer. The transformers that came with the radios appear to have moisture in them, probably from years of storage in a humid environment. The one transformer that I have tried to power up on a variac started to sizzle when I got to 50 VAC on the primaries, so I powered down. I plan to attempt to dry out the old transformers, but I would prefer to replace both with new, known to be good units.

I have looked over the offerings from Antique Electronics Supply, and their Fender transformers are a close match. Unfortunately, the Fender transformers offered there top out at 325-0-325 V for the secondary windings. I need a transformer with 350-0-350 V / 70 mA, 5 VAC / 2A, and 6.3 VAC / 2.6A secondary windings.

I would also be interested in finding out a place to send the old transformers for rewinding if nothing is available for replacement.

Meanwhile, while I search for replacements I plan to attempt to dry out the old units by removing their shell covers and sealing them in an airtight container with silica gel for a dessicant, for about a week to ten days. I have read of techniques for drying out transformers that involve running a low DC voltage in the primary for several tays to heat up the transformer so that the water could be cooked out. The risk of arcing and/or electrolytic corrosion makes this approach seem risky to me. I am not particularly interested in setting up an oven to passively dry out these things, so a chemical dessicant seemed a reasonable approach. I work in a university chemistry department, so if I can find some sort of vacuum chamber, I might try to remove the water that way also.

The sizzled transformer mentioned above was not an original Hallicrafters unit, but some sort of replacement that a prior owner used (vinyl covered wire leads vs. cloth covered in the radio). I have two other transformers that are original Hallicrafters units, but given their age I am not optimistic about them.

One of these radios is a gift for my father, so I would prefer a "new" replacement transformer that I don't have to worry about leaking current or eventually going up in flames.

Thanks in advance for any suggestions or ideas that can be offered

Steve Burrows

Here is the thought process:

I have held a First Class (now General) FCC Radiotelephone license
since March 1972.
I am currently a NARTE Certified Engineer in AM, FM and Microwave
Broadcast systems.
My primary MOS in the military was 05C20, which means I could send and
receive code at 17WPM.
Yet I have no ham license, therefore I am locked out from this forum.

It boggles my mind that someone has decided I need to wear a baseball
cap with a callsign printed on it in order to be deemed qualified to
have a legitimate interest in the topics presented.

The difference between 325V and 350V isn't much. I can't think of a single reason why the radio wouldn't perform well if the plate voltage was reduced by less than 10%. If you're really worried about the 25V, you could probably get it back if you used a solid state rectifier rather than the tube rectifier.

If the power transformer is moisture damaged, there might be more damage in the IF transformers and RF coils. These are common radios. You might want to consider the unknown costs and potential problems in fixing up these radios as compared to simply recapping and checking the resistors on a known

working S-40B.

ement that a prior owner used (vinyl covered
> wire leads vs. cloth covered in the radio). I have two other transformers

If the transformers work, they should at least be good for bench testing the
radios.

That transformer with the 325-0-325 volt secondary will work just fine.
Put it in and don't look back. With today's higher line voltages, I
suspect the B+ voltage will be very close to spec. Exact B+ isn't that
important anyway.

Best Regards,
Ed

Oh, no; I've had this one for ... 3 or 4 years now, and just haven't dug into it, what with losing a wife to MS, getting married again, moving the new wife and The Boy and The Dog and The Cats in. I've done well to get my General and Extra and scoop out a place for the R-390.

I bought it (the 6217E) as-is, and that's what I got. I've had considerable time to fiddle with it, and done a fair amount of fiddling, but it just isn't all that happy a receiver.

Pointers to the NTE replacements, or (even better) to the original Ge input transistors will be very greatly appreciated indeed.

Go with the Fender, and see what the actual operating voltages are. I
suspect that the output of the Fender transformer will be higher than
rated if they are operated below full rated load.

If the B+ is not in the correct range with the new transformer, swap
the rectifier tube out for silicon. You'll gain probably more than 25V
in the process.

>I would also be interested in finding out a place to send the old
>transformers for rewinding if nothing is available for replacement.

Peter Dahl Co. in Texas will rewind them, and they will also probably
be willing to build you a new one that is a better match for the original
Hallicrafter part. They might even have the drawings for the original,
even. They will charge a lot of money, but their work is magnificent
and as far as I can tell their rebuilts are far more reliable than the
original windings.

Thet's one of the reasons I bought a drill press. On the other hand
square holes are still a bitch without the right punch. Someone swiped
most of my punches but they missed the 1/2" "D" punch for fuse holders.

I've commented before - and found from their response that the attitude of several of those whom "represent" that "venue" are typical of many HAMs: arrogant snob.

Seems to me they should have been honest and name their "club" snobhams.com rather than besmirch the good name of three respected companies, since their interest is clearly promoting HAM radio rather than promoting a legitimate exchange among any persons with an interest in the equipment the site's named after. Otherwise - why would a HAM radio license be "the ticket"? (the *only* ticket).

I mean - how arrogant: Take Collins - I'm certain that if you added up all of the "business" $$$ spent by HAMs vs. the "other" business customers (commercial, military, etc.) of Collins (not after market - or surplus -- just sales that *directly* benefitted Collins) --- HAMs would find they have *very* little legitimate claim of "exclusivity" to the name, heritage, etc. But obviously - that matters not to their "we're the ones" mentality... WE thought of the name - and WE want to promote US.

I guess we could start a westernelectric-harris-continental.com club - only P1s or P2s need apply!

- but, no, not me. *I* don't care if someone is *only* a HAM... (or a GROL) - they'd be welcome anyway. So I guess - I'm not "qualified" to be a HAM - I'm not "snob" enough.

Actually - a more appropriate name for "them" might be

heathkit-drake-ricebox.com

That seem like a far more legitimate name for a HAM club...

just my .02

That's really only for oil-cooled transformers in electricity substations,
where you had to get *all* the moisture out of the (paper) insulation
before filling with oil or bad things happened when you applied power.

> The risk of arcing and/or electrolytic

Keeping it in a warm/hot place, sealed up with some dessicant is
probably the best bet, but it will take quite a long time. The
vacuum trick sounds like a good idea, but might give problems
with plastic insulation if you pump it down too far.

Best,
Chris.

Oh, I don't know - most of what I worked on in the Navy was Raytheon or such - and wasn't all that bad. The unit I worked on the most was the SPS-10E - which (at the time) was pretty much state-of-the-art, and was pretty straight forward.

I have heard some unflattering things about Grumman (from some friends down on the coast around Ingalls) - so you're probably quite right about their (lack of) quality. We've a Raytheon plant in Forest, MS (about halfway between here and Jackson) - and they have a quite good reputation for the military "stuff" they're making (which, unfortunately - they can't talk about much - but names like Sentinel; and words about the APG-63(V)1 fire control radar system / I.E. F-15 Eagle are sometimes heard in press releases).

best regards...

The Really Good News is that the 2 transistors in the RF amp appear, from the schematic and parts list, to be 2N23478, and Dan's Small Parts carries them for $0.75 each. I haven't looked into the radio itself, and need to do that before I order, just to see that's really there.

It'll be a bit before I go much farther on this, as I'm having multiple attacks of Real Life[1] and don't have bench space or time to open the 6217E up. Maybe I won't need to learn American Sign Language to understand what's coming out of the 6217E. And yes, that's a joke: the XYL and I have a deal. She passes Element 1, and then I learn ASL and pass the ASL exam.

[1] Life is what happens to you while you're making other plans.

>
> reg
>

Hi Reggie,

If you look at the knob marked "Detector Mode", you will see the
following:

FM, SSB +1.5, SSB -1.5, AM, +6, +3, 0, -3, -6

The +1.5 means lower sideband, the -1.5 means upper sideband.

The +6 means the "0" position on the TUNE control is +6KHz.
The +3 means the "0" position on the TUNE control is +3KHz.
The 0 means the "0" position on the TUNE control is +0KHz.

...

If you put the Function switch in BFO check, and the Detector mode
switch in the "0" position, and the BFO TUNE knob at zero, you should
get a zero beat.

If you are in the "+6" position, you should get a zero beat when the
BFO TUNE knob is at the "-" position.

Might be a good idea. They can investigate some of those 5KW and 10KW commercial AM rigs. I heard that they now have a method to determine how long it has been since a rig was powered up by measuring the residual electrons in capacitors and applying a couple other parameters.

Hi Reggie,

That just means that the BFO circuit isn't quite balanced, but it is not
really a problem. The +/-3 and +/-6 positions are there to allow you to
use single sideband using wider filters, and "higher fidelity" modulation.
(some examples of when you might do this are some of the fancier modulation
schemes used in data/fax transmission.)

I was concerned that your bfo might have been stuck +6 high, or -6 low,
and then when you were trying to zero beat on WWV, you would never
get there.

So a few AM outlaws makes it OK for a group of
SSB operators to intentionally jam legit stations-
even a veteran-connected special events station- for years?
Your logic is.... interesting.

Just curious:
When you back into someone's car, do
you blame them for parking it there?

Hi,

my dummyload is leaky.
At the central conductor drops a small amount of oil.

So I tried to disassemble it and to tight up the letting through.
My 3/32-inch inbus-key fits but Iï¿½m not able to loose it.
It seems that the central conductor canï¿½t be disassembled.

Would it be possilble to give me an advice?

The CAP transmitters were not "Aircraft" in the normal sense but were
outside the amateur
band in the military frequency band. Some Amateur equipment was used on
the ground
and special equipment was used in the aircraft. (as I remember :-))

The CAP transmitters were not "Aircraft" in the normal sense but were
outside the amateur
band in the military frequency band. Some Amateur equipment was used on
the ground
and special equipment was used in the aircraft. (as I remember :-))

FS: UNBUILT HEATHKIT - TV Remote Control GRA-2001-6

A nice example of a vintage unbuilt Heathkit in excellent condition.
Remote control for Heatkit GRA-2001 Televison Set. This kit contains
both the hand-held transmitter control and the receiver portion that is
wired into the the television.

The kit displays nicely and appears to be complete with all
documentation. There is some writing on one side of the box.

Manufactured by The Heath Company, Benton Harbor, Michigan.

Picture at:
http://mywebpages.comcast.net/mnowlen/heathkit-gra2001.html

$225

Includes shipping, packing and insurance in continental US. Email for
other locations Outer shipping carton and additional packing will be
supplied at no charge.

Payment options are Postal Money Orders drawn on a US bank, Personal
Check with wait for clear. or PayPal.

FS:Bird Model 74 Coaxwitch **NEW** 6 Position Coax Switch

I am selling a hard to find Bird model #74 6 position "N" connector coax switch, called the COAXWITCH. Designed for commercial service. Has minimal insertion loss. Pull out, turn and push in type switch handle. Sure locking and tight connection. It is new and unused in original box and packing with instructions.

Pictures at:
http://mywebpages.comcast.net/mnowlen/bird-74-front.jpg
http://mywebpages.comcast.net/mnowlen/bird-74-back.jpg
The cardboard is part of the packing and has never been removed.

Useful Freq Range: DC to 10 GHz
Max RF Voltage: 500 VRMS (Note: this is 5KW at 50 ohms)
Atten to unused Channel: 75dB

Frequency VSWR Loss (dB) Max RF Power Rating (Watts)
100 MHz - 0.02 850
1 GHz 1.06 0.09 200
4 GHz 1.3 0.22 75

Original cost is near $500.

$150
+ $10 Shipping in Continetial US

Thanks for reading.

Peter,
My termaline was a little leaky too, and it took me a while
to figure out how to take it apart. The secret is there is an allen
screw on the inside that you have to engage with the proper allen
wrench, and once you do this, you will see on the other side what
turns, and how it comes apart. It has been five or six years since I
fixed mine, but I remember I left in the original gasket, (I think an
"O" ring) and made the new one out of if I remember correctly, was
.025 thick gasket material. The homemade gasket was round, with a hole
in it, and when added to the original assembly, you will see that
after you tighten the allen screw, the assembly will not "spin" but
tighten up fast, and stop the leak. I'm sorry, but that about all I
recall, but it should give you a good start on stopping your leak!
Best 73, Anthony, WB8MLA

Message-ID: <vPnae.507$Yc.282@trnddc06>
Source record: 18419

Can I expect speaker to mute completely if I use high impedance 2k ohm
headphones?
I still get some sound from the speaker.
I even plugged in a spare unwired phone plug.and still got speaker sound.
It looks to me like that should have created a open circuit to the speaker.
Is this normal or is something wrong with this thing?
I was trying to get out of rewireing it for low impedance phones

Source record: 18421

The HW101 puts the speaker and whatever is plugged into the headphone
jack in series. When nothing is plugged into the headphone jack, the
contacts in the jack directly ground the jack side of the speaker.

So, if you use high impedance headphones, you will still get a little
mumble out of the speaker, but not very much.

-Chuck

Source record: 18426

FS: Clegg model FM-27B 2-meter amateur transceiver. It is a 146.0 to 147.99 MHz, narrow-band (5 KHz), 25 watt mobile transceiver. The radio utilizes a 'crystalplexer' frequency synthesizer system to generate the transmit and receive channels. The receiver works fine, but have not checked out the transmitter. Don't have a manual and frankly can't figure out how to get the cabinet off. The cabinet is in good condition, having only a few very scratches. The front panel has some tarnish and scratches. Include is the original microphone, power cord, locking mounting bracket (no key). Price is $40 shipping in lower 48. Thanks, Charlie Hugg, K5MBX

Has anyone converted one of these amps to a WARC band operation (eg.,
17 meters?)

Since the amp has coils taped for both 20 and 15 meters, is there any
risk to setting the band selector to the 15 meter tap and tuning it for
maximum output on 17 meters?

Thanks for any suggestions,

Chuck

The FM27B generated spurs all over the place basically from about 130MHz up to 180MHz. The fortunate thing, for Clegg, was the spurs were mostly located in ham frequencies, and in a few unused government allocations.

This got Heath in big trouble, as they used the Clegg's spurious emissions as the standard with which to measure their new synthesized 2M rig. The only problem was that their rig put out spurs of the same amplitude in the middle of the public service allocations. Hams using the Heath rig were unintentionally keying up police and fire repeaters in towns all over the country....OOPS! Major recall time.

Now-a-days, using a Clegg is a very dangerous thing todo. The allocations have changed, and what was once unoccupied, is now in use. You are bound to get busted for interferrence.

-Chuck

Why not just download some DSP software, hook an audio out to the line in of
your computer sound card and try some processing for yourself?

Regards,
John

Source record: 18437

For those of us who like the warm tube radio sound, I have found that the Drake 2-A and Drake 2-B are not only great old amateur receivers, but they make great short receivers as well. JAN crystals still custom makes crystals that will allow the Drakes to tune 49, 31, 25, and 16 meter SW bands.

With the SW crystals, the radios offers triple conversion, high sensitvity, selectable selectivity, stable and accurate LMO, all in a small package size that doesn't take up a table. The matching Q multiplier/speaker is a plus also.

I am sure that I'm not the first to find this out, but I thought I would pass along my satisfaction with these grand old radio receivers.

Jim

Source record: 18438

For AM reception, the 2A has a bit wider filter range than the 2B.

Big drawback to either is that it is much smaller than most accompanying BA transmitters - except for the Harvey Wells.

Years ago a friend of mine owned an NC-183D. One day he brought a 2B home to compare. The next day he gave away his NC-183D to a neighbor kid and bought the 2B.

1856. Galaxy V Panel Meter Calibration

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-25 01:33:05 UTC
From: Edward Knobloch <alias@nowhere.net>
Message-ID: <INXae.3578$WX.1854@trndny01>
Source record: 18445

Hi, Gang

I've recently picked up a 1966 vintage WRL Galaxy V transceiver -
a nice rig, once you get over the fear of imminant electrocution
(no cover over the 950V on the final tubes, not even
a latch to hold the cabinet lid down.) It was obviously built
to a price, but has held up well.

The panel meter is only marked in S/Units, with a few marks
labeled "tune" "Voice" and "cw". I hooked an external d.c.
current source to the common cathodes of the final tubes,
and ran a calibration check, since the manual didn't disclose
what the panel meter marks represented. I held the small T/R
relay closed by hand, so the panel meter would be set up
to indicate cathode current.

The "S 4-1/2" point (for SSB bias with no drive), is 60mA.
The "tune" point is 200 mA.
The "c.w." point is 380 mA.

73,
Ed Knobloch

If you do this (at low power, of course), does it tune up, or does the
control get all the way to the end before you find a peak? If you can
tune it up, there should be no problem, but you may not be able to.

First, thanks for letting me invade a group I normally don't visit.

As part of a truck load purchase, I acquired a Gray Military Code practice machine with the paper tape. It is a model TG-10-J. Looks in good condition with a practice tape.

Do these have any value to collectors?

There is also a massive Thordasen power transformer with a pair of 866A's. Looks like a Frankenstein piece.

Any info would be appreciated.

Johnson Viking Invader 2000 LSB/USB/AM/CW
Please make serious offer.

All Lights and fans work too!!!! And of course I have the hook up cables.
And Also Comes with the Johnson Power Supply and works great.
They made a lower powered version Invader for 600.00 in the 60s and a high powered
version in the 60's High powered version was a whopping 1200.00 back then.
And this is the HIGH POWERED VERSION!!!! Only made a little over 300 of these transmitters. Its very rare to see one forsale.
Came from an estate and was tested and yes it works!! No hums at all.
One of the meters was sticky so you may have to spray with cleaner.
The power supply Works great and has no dents on it at all.
The Transmitter cabinet has no dents at all.
The Front panel on the Johnson Viking Invader 2000 is VERY NICE!!
The inside of the Invader is nice as well.
The only thing you would do is respray the both cabinets because they have paint chips off of them. And the bezel around the cabinet, But front is GREAT!

I found a site that gives info and I copied it, Here is what they say about this GEM>
The E. F. Johnson Viking Invader 2000 Transmitter was the high power version of the Invader 200. The exciter used a Crystal fitler for Single Side Band generation and had a power output of 160 watts thru 2 6146 finals. The Amplifier RF deck consisted of 2 4-400 Power Tubes running 2200 Volts on the plates. The Invader 2000 produced 2000 watts input power on SSB. Hence its name. The out board Power Supply the same size as the radio in volume and weighs about 125 Lbs. The neated thing about the Invader 2000 is the light orange glow of the 4-400s when they are working. The Invader 2000 was manufactured in 1961 and sold for $1229.00. The Invader 200 sold for $619.50.

I don't know diddly about military equipment, but I own a civilian code practice machine that my son talked me into buying (for almost nothing) at a swap meet. Since I don't have its paper tapes, it's more of a curiosity than anything else.

Maybe someone who knows about military stuff can give more useful advice . . .

Hi Reggie,

I'm glad it worked out for you. The 6217 is a nice receiver, with
excellent audio. I think you will enjoy yours. One word of caution,
it doesn't take too kindly to front end overload.

-Chuck

Hello Anthony,

the parts are wrenched together that it seems that they are invented as
a single piece.
I have no idea how to turn the allen-screw.
Would it be possible to describe what part has to be fixed and how the
allen screw has to be turned?

New Program "TWINTUNE.exe"

Using a tuning capacitor across one end of a balanced-twin line with a
short circuit at the other, the combination of line and capacitor
behaves as a high-Q parallel-tuned circuit.

Applications include push-pull VHF power amplifiers and power
oscillators.

The program also assists with design of ordinary HF balanced-twin
open-wire transmission lines. Zo and attenuation is computed.

Download program TWINTUNE from website below in a few seconds and run
immediately.

1889. Galaxy V Schematic - a readable copy found online

Newsgroup: rec.radio.amateur.boatanchors
Date: 2005-04-27 22:35:13 UTC
From: Edward Knobloch <alias@nowhere.net>
Message-ID: <BsUbe.9316$O2.83@trndny04>
Source record: 18478

Hi, Gang

Owners of the Galaxy V transceiver who can't read the tiny schematic
will be please to know that an enthusiast took the trouble
to make a readable copy.

Go to the "downloads" section of www.worldradiolabs.com
and get the schematic (in bitmapped form - MS Paint).

The free XNView image viewer printed the bitmapped schematic
over 15 each 8-1/2 by 11 pages. A little work with scissors
and Scotch tape, and my tired eyes are now very happy looking
at the schematic.

Also, owners of the Galaxy V may be interested in looking
at photos of the interior of the Galaxy 300 transceiver,
a predecessor unit
www.fayoly.net/gallery/galaxy300

The underside is amazingly uncrowded compared to the Galaxy V,
but the heritage is plain.

73,
Ed Knobloch

Hi Peter,
Yes, I know that they appear to be built as a single
piece, but, I assure you, they are not! To engage the allen screw, I
used a "T" handle allen wrench to loosen the assembly. You will see
that the assembly front to back, spins (and thus allows oil to seep
out). As I said earlier, there wasn't any part that had to be fixed!
The problem was that after a number of years, the round teflon
insulator had become compressed perhaps .005 or .010 of an inch, and
the internal "O" ring didn't have enough pressure against the flat
surface to seal the assembly. All I did to remedy this problem was
make a round gasket with a hole in it out of .025 inch gasket
material. I put this gasket against the "O" ring. All this gasket did
was take up the free space where the teflon insulator had "crushed"
over the years. I could have just made a new teflon insulator on a
lathe, but this was a simple fix, in other words, I shimmed the teflon
insulator so its thickness with the gasket provided sufficent pressure

against the "O" ring to prevent any leaks. Again, once you figure out how to take it apart, you will see what I mean. Perhaps you could ask a mechanic friend to help you on this if you cannot figure it out how to disassemble it, as, after six years, I cannot remember verbatim the exact way I did it, step by step, but its just a bit tricky, thats all.. Once you put it back together with the new "shim" gasket, you will see that as you tighten the assembly, it will no longer "spin" when it is tight, thus, it will not leak oil either! Sorry I cannot remember everything step by step, but you can do it! Best Luck es 73 OM... Anthony de WB8MLA

Thank you so much Anthony,

I belive my allen srcew has been sized. So it is only possible to drill out the parts or - thatï¿½s the better idea - to strangle an elastomer string behind the resistor contact.

My HW-101 seems to jump frequencies up or down 3 to 5 khz both on transmit and receive, I understand about a drifting problem during warm up but the sudden shift in frequency even after a couple of hours of use and have noticed that the power out is also never stable. Any ideas on a fix or comments appreciated.

Gil

One drop of Cramolin in each the rear and front bearing of the VFO variable tuning cap.

Possible bad cap in VFO circuit.

Most likely a candidate for an ebay sale.

Hi Ron .... beautiful collection of goodies and radios....
Have a question for you about one thats in this picture...

http://radioheaven.homestead.com/files/bookcase.JPG

The AK console on the left.... under the metal coffin boxes...
what model # is the radio thats in it?... maybe a 20C
or one of the other breadbox units #33 perhaps?...
yes I have one... that is incomplete.. and need to know
what to look for to complete it....

John k9uwa

No, Mr. & Mrs. Guttery meant that they don't like arrogant people (hams or otherwise) that DON'T FOLLOW RULES and does so intentionally and with full disdain for others whom share this medium. Guess who the NEXT post (on my server after Paul's) - is by (is there any suspense as to who?)

(continued as a reply to that post)...

I'd guess that an oscillator (either VFO or crystal, but more likely crystal) is
unstable. If an oscillator output level is changing that could explain the change in output
power. The HW-series had problems with resistors in the tube B+ circuits dissipating a bit of power and changing values. To troubleshoot, verify the signal
levels and correct frequency of all the oscillators, and measure the B+ on all the tubes. Be careful measuring the B+, it's awful easy to get a nasty shock;
use the one-hand in your pocket at all times approach.
